

# GHG emissions from peatlands: Effects of rewetting and land use

Jurasinski G, Günther A, Huth V, Glatzel S, Couwenberg J  
RRR 2013 Greifswald, Germany

# Annual GHG exchange is mainly driven by mean annual water level

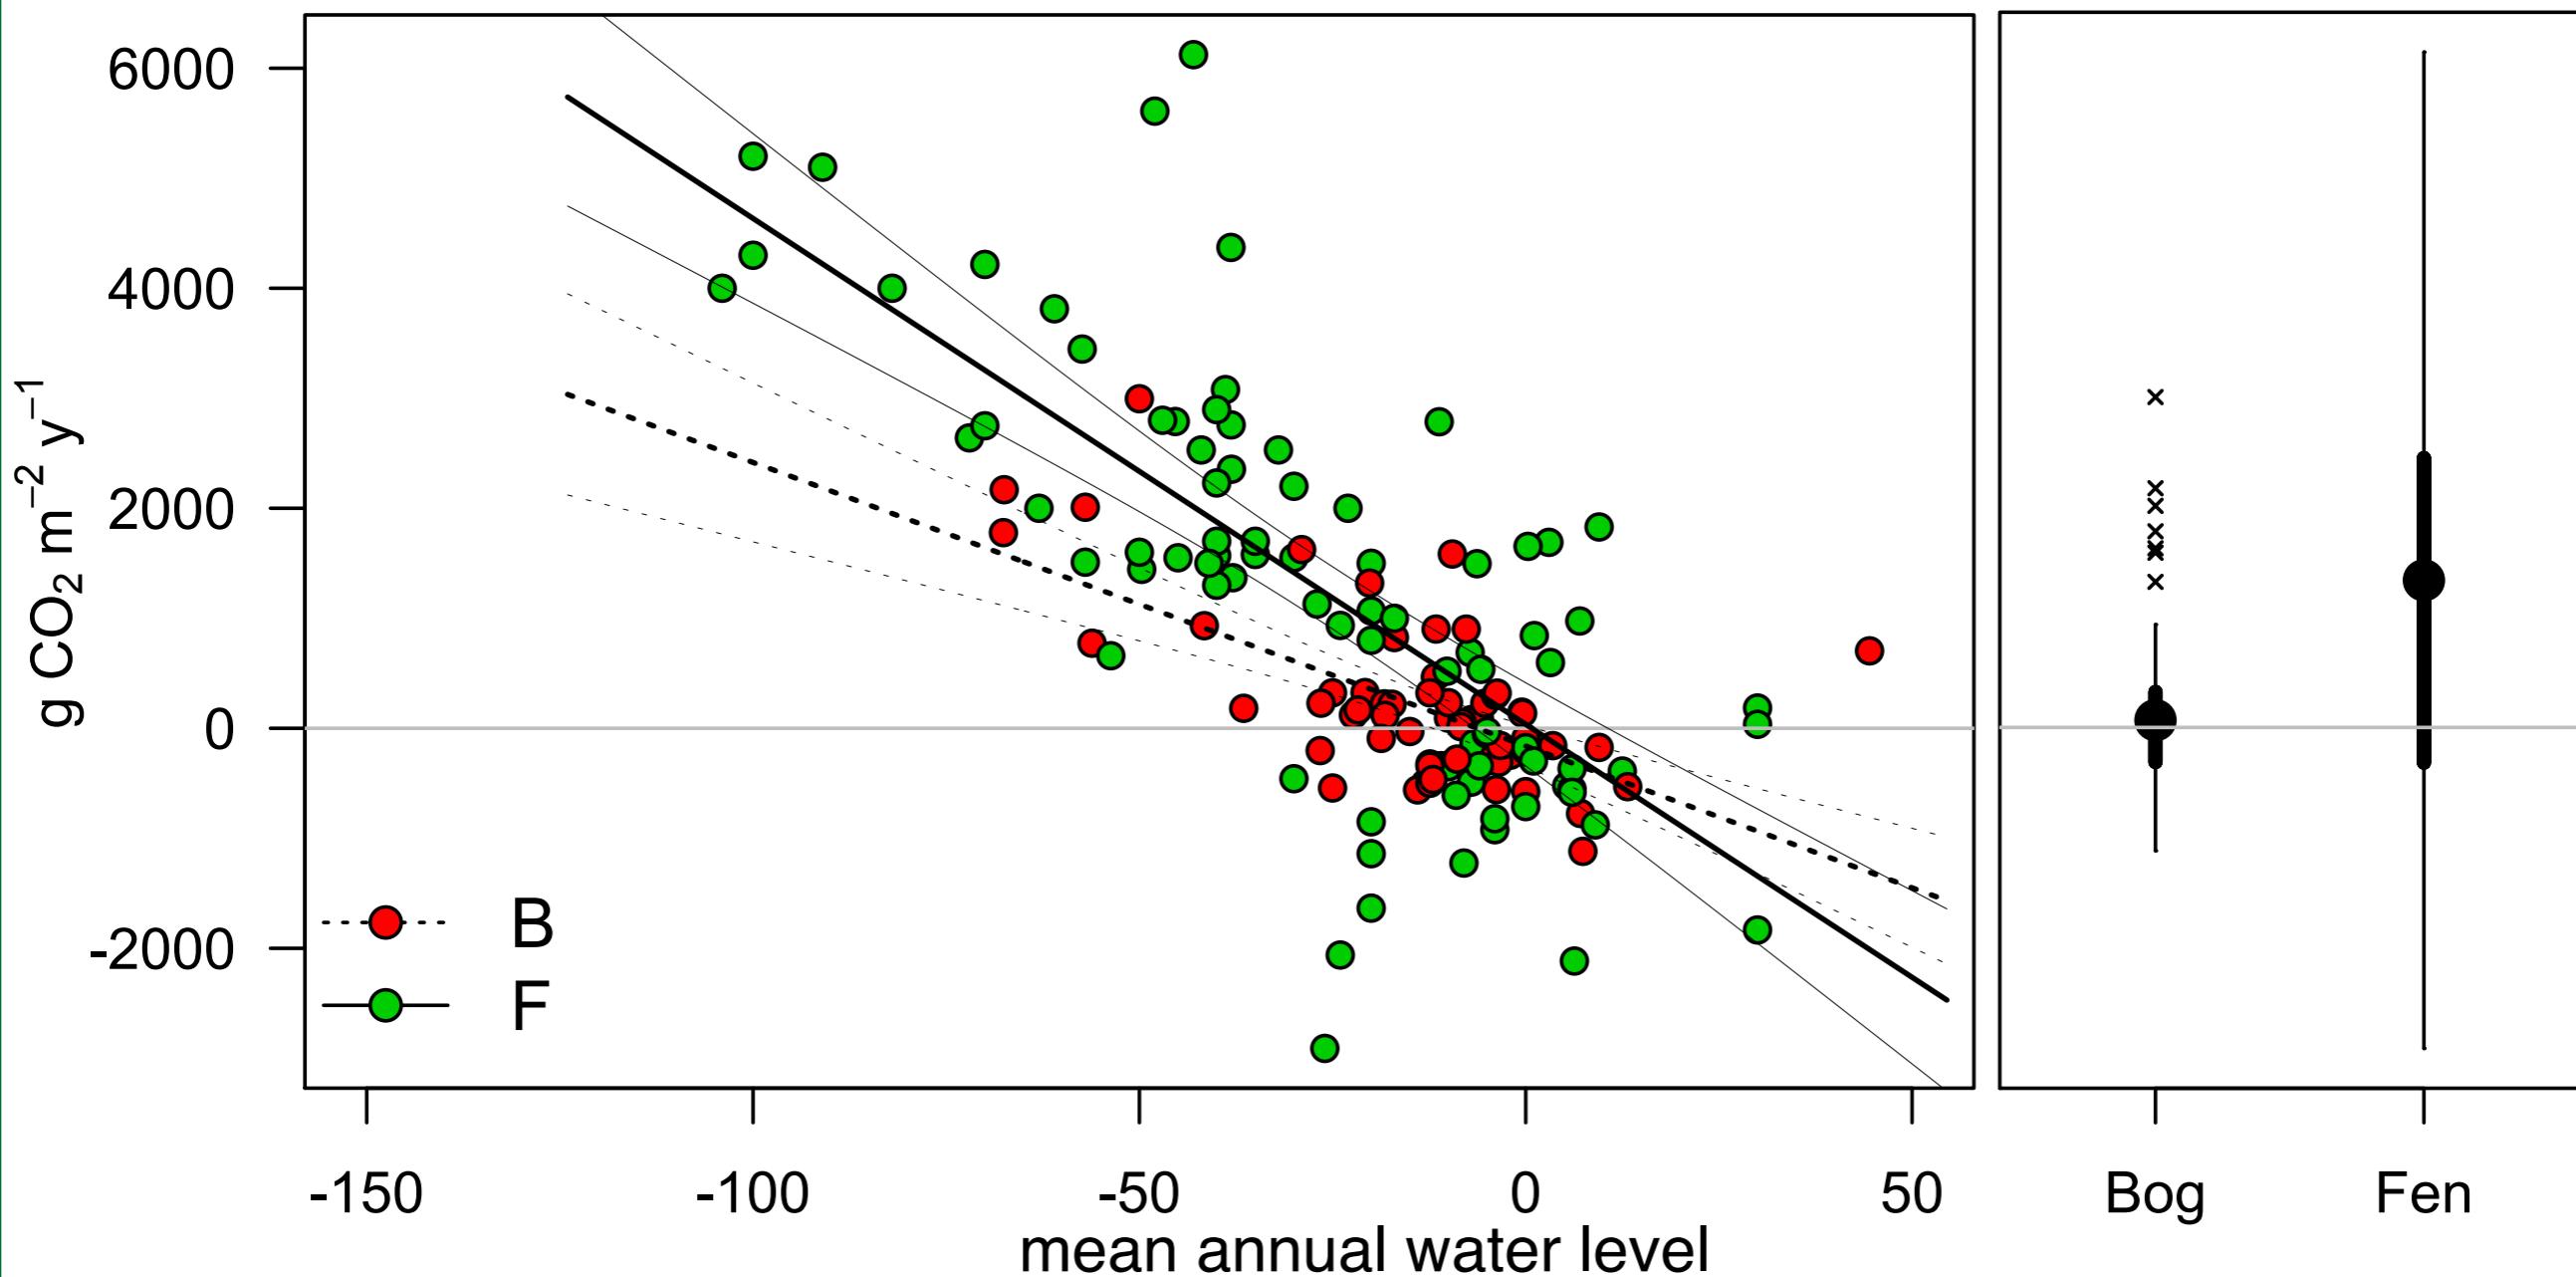

# Data on GHG exchange in temperate wetlands

- 52 studies (incl. unpublished data sets)
- 594 data points ( $\text{CO}_2$ : 161,  $\text{CH}_4$ : 261,  $\text{N}_2\text{O}$ : 171)
- Closed chamber (542), eddy covariance (25), other (27)
- Recorded from 1992 to 2012 (relatively evenly distributed)
- In Fens (380), Bogs (156), Others (58)

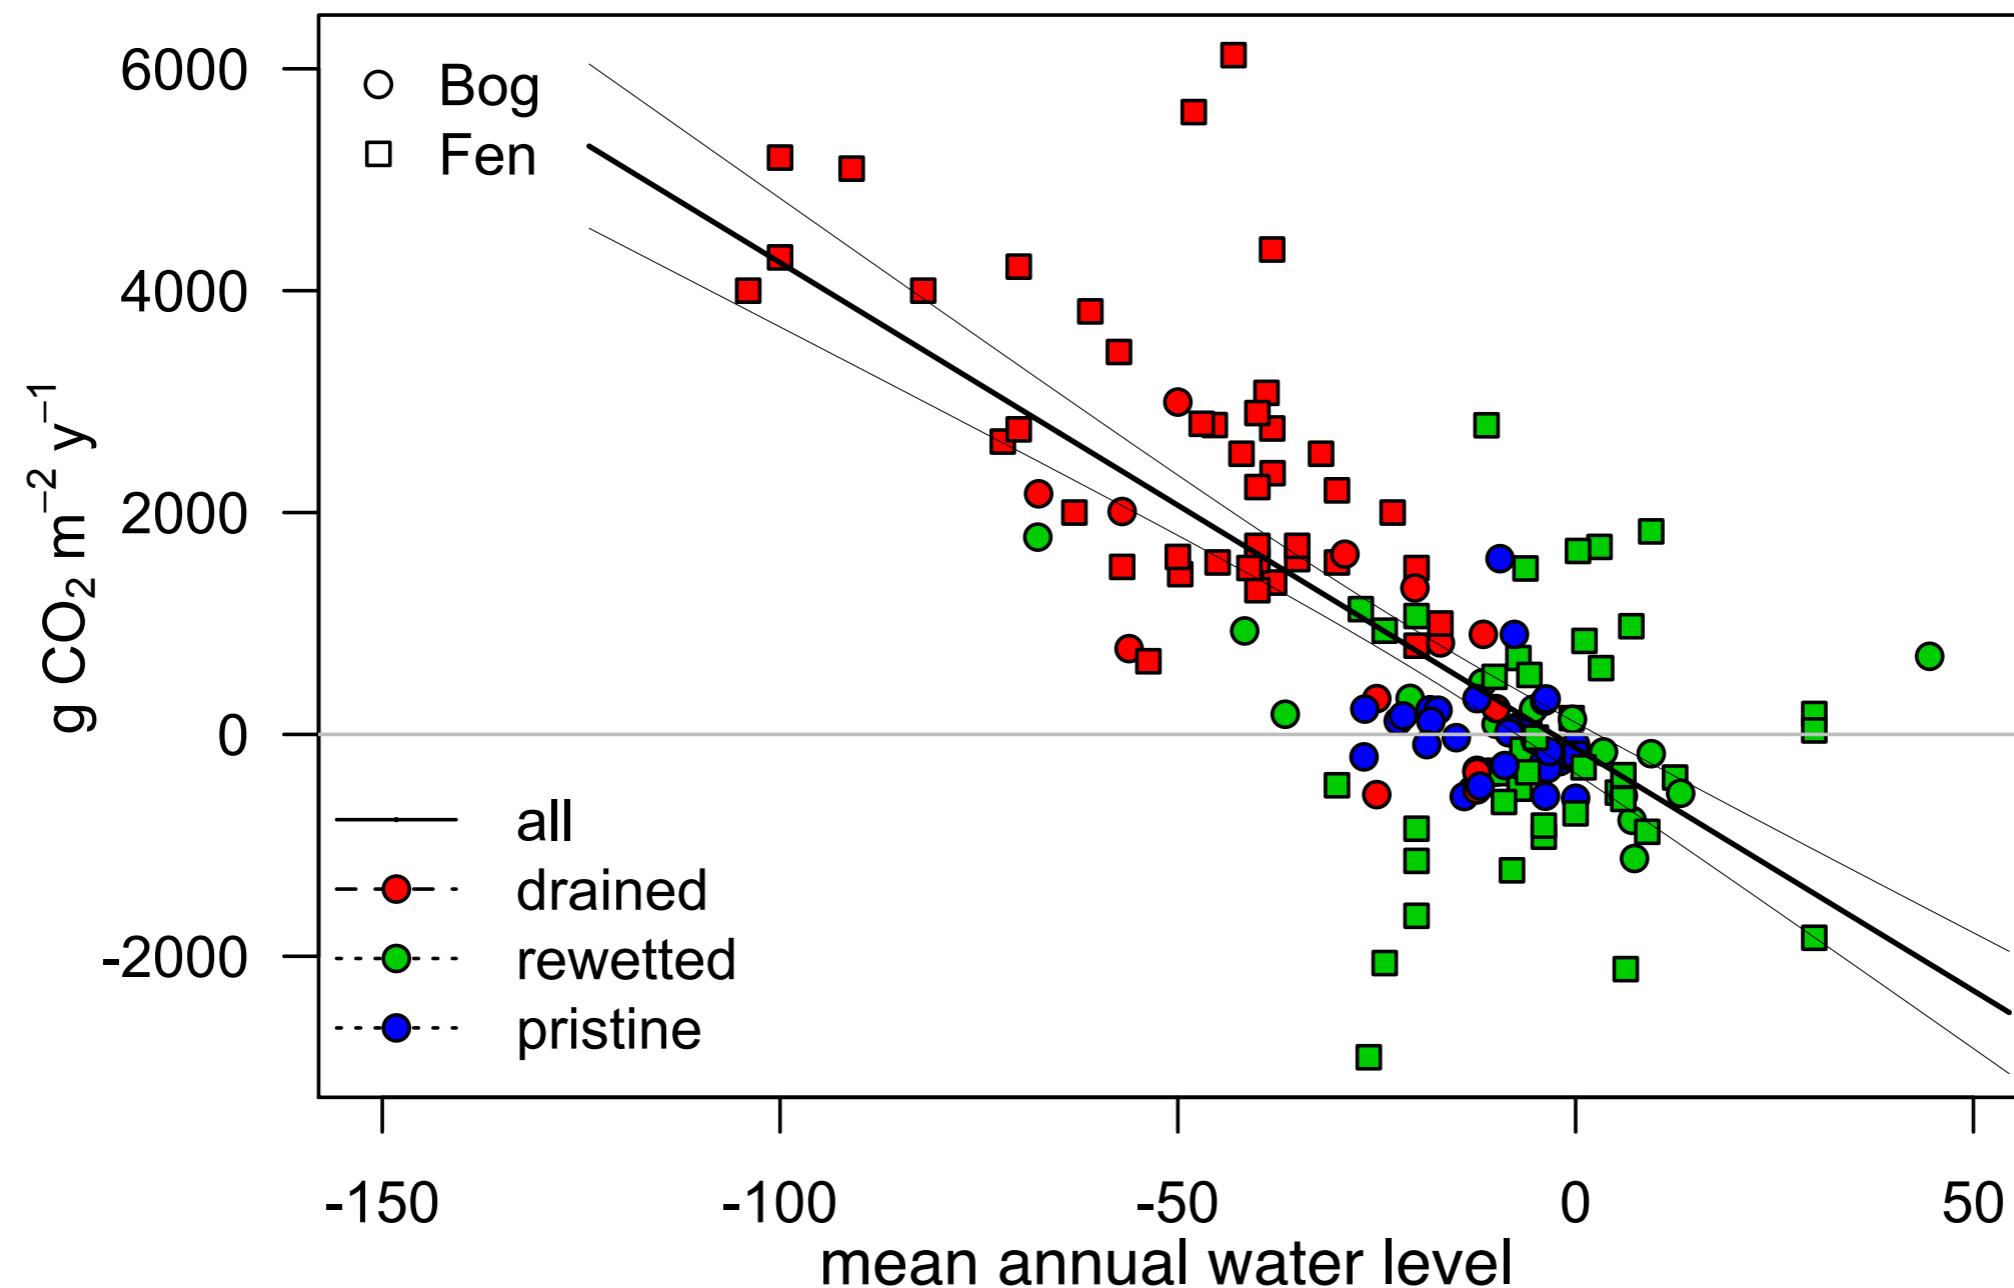

# $\text{CO}_2$ exchange is driven by water level across peatland types

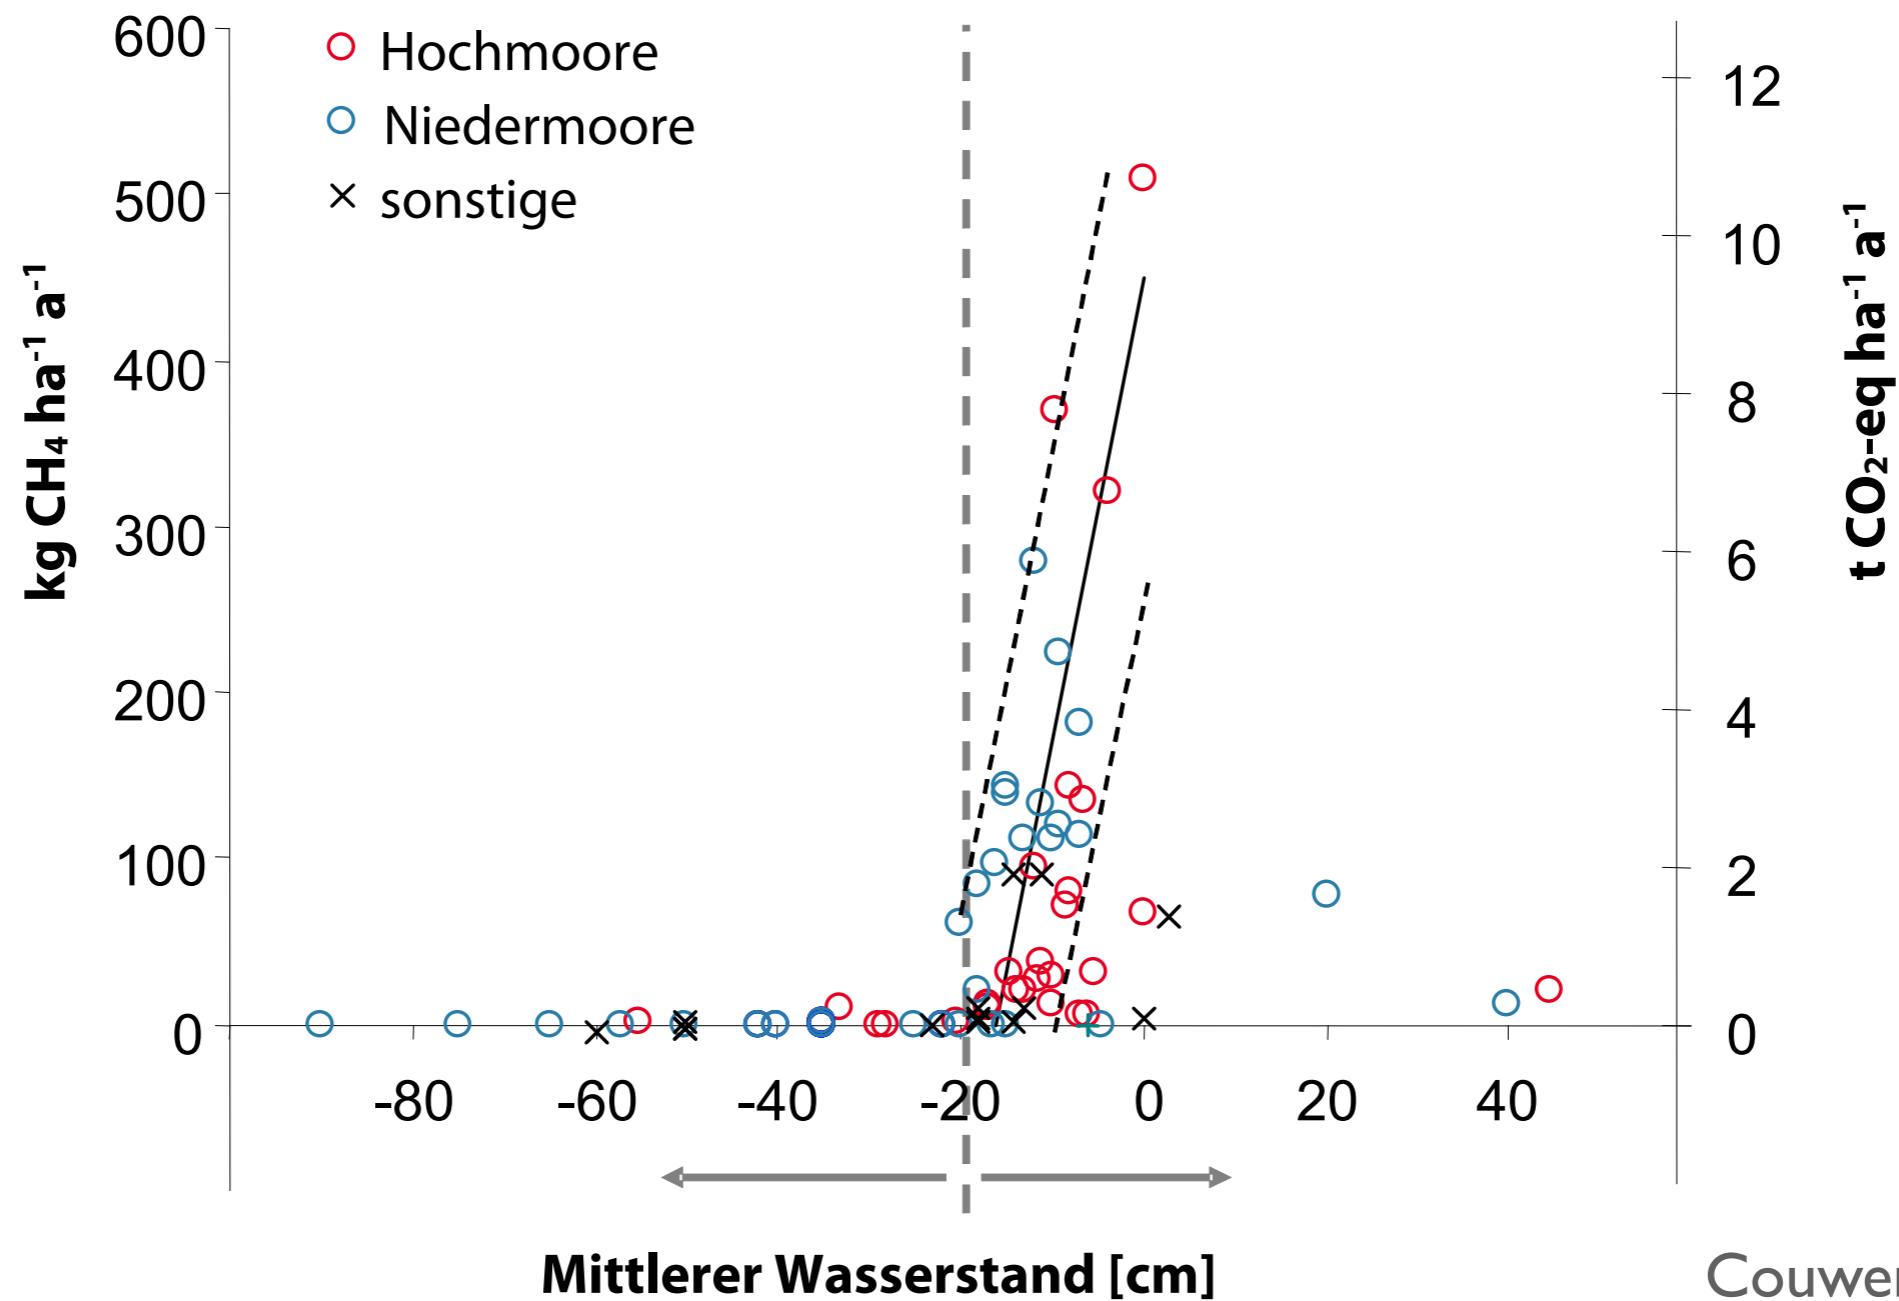

# Drainage increases CO<sub>2</sub> emissions and rewetting effectively stops them.

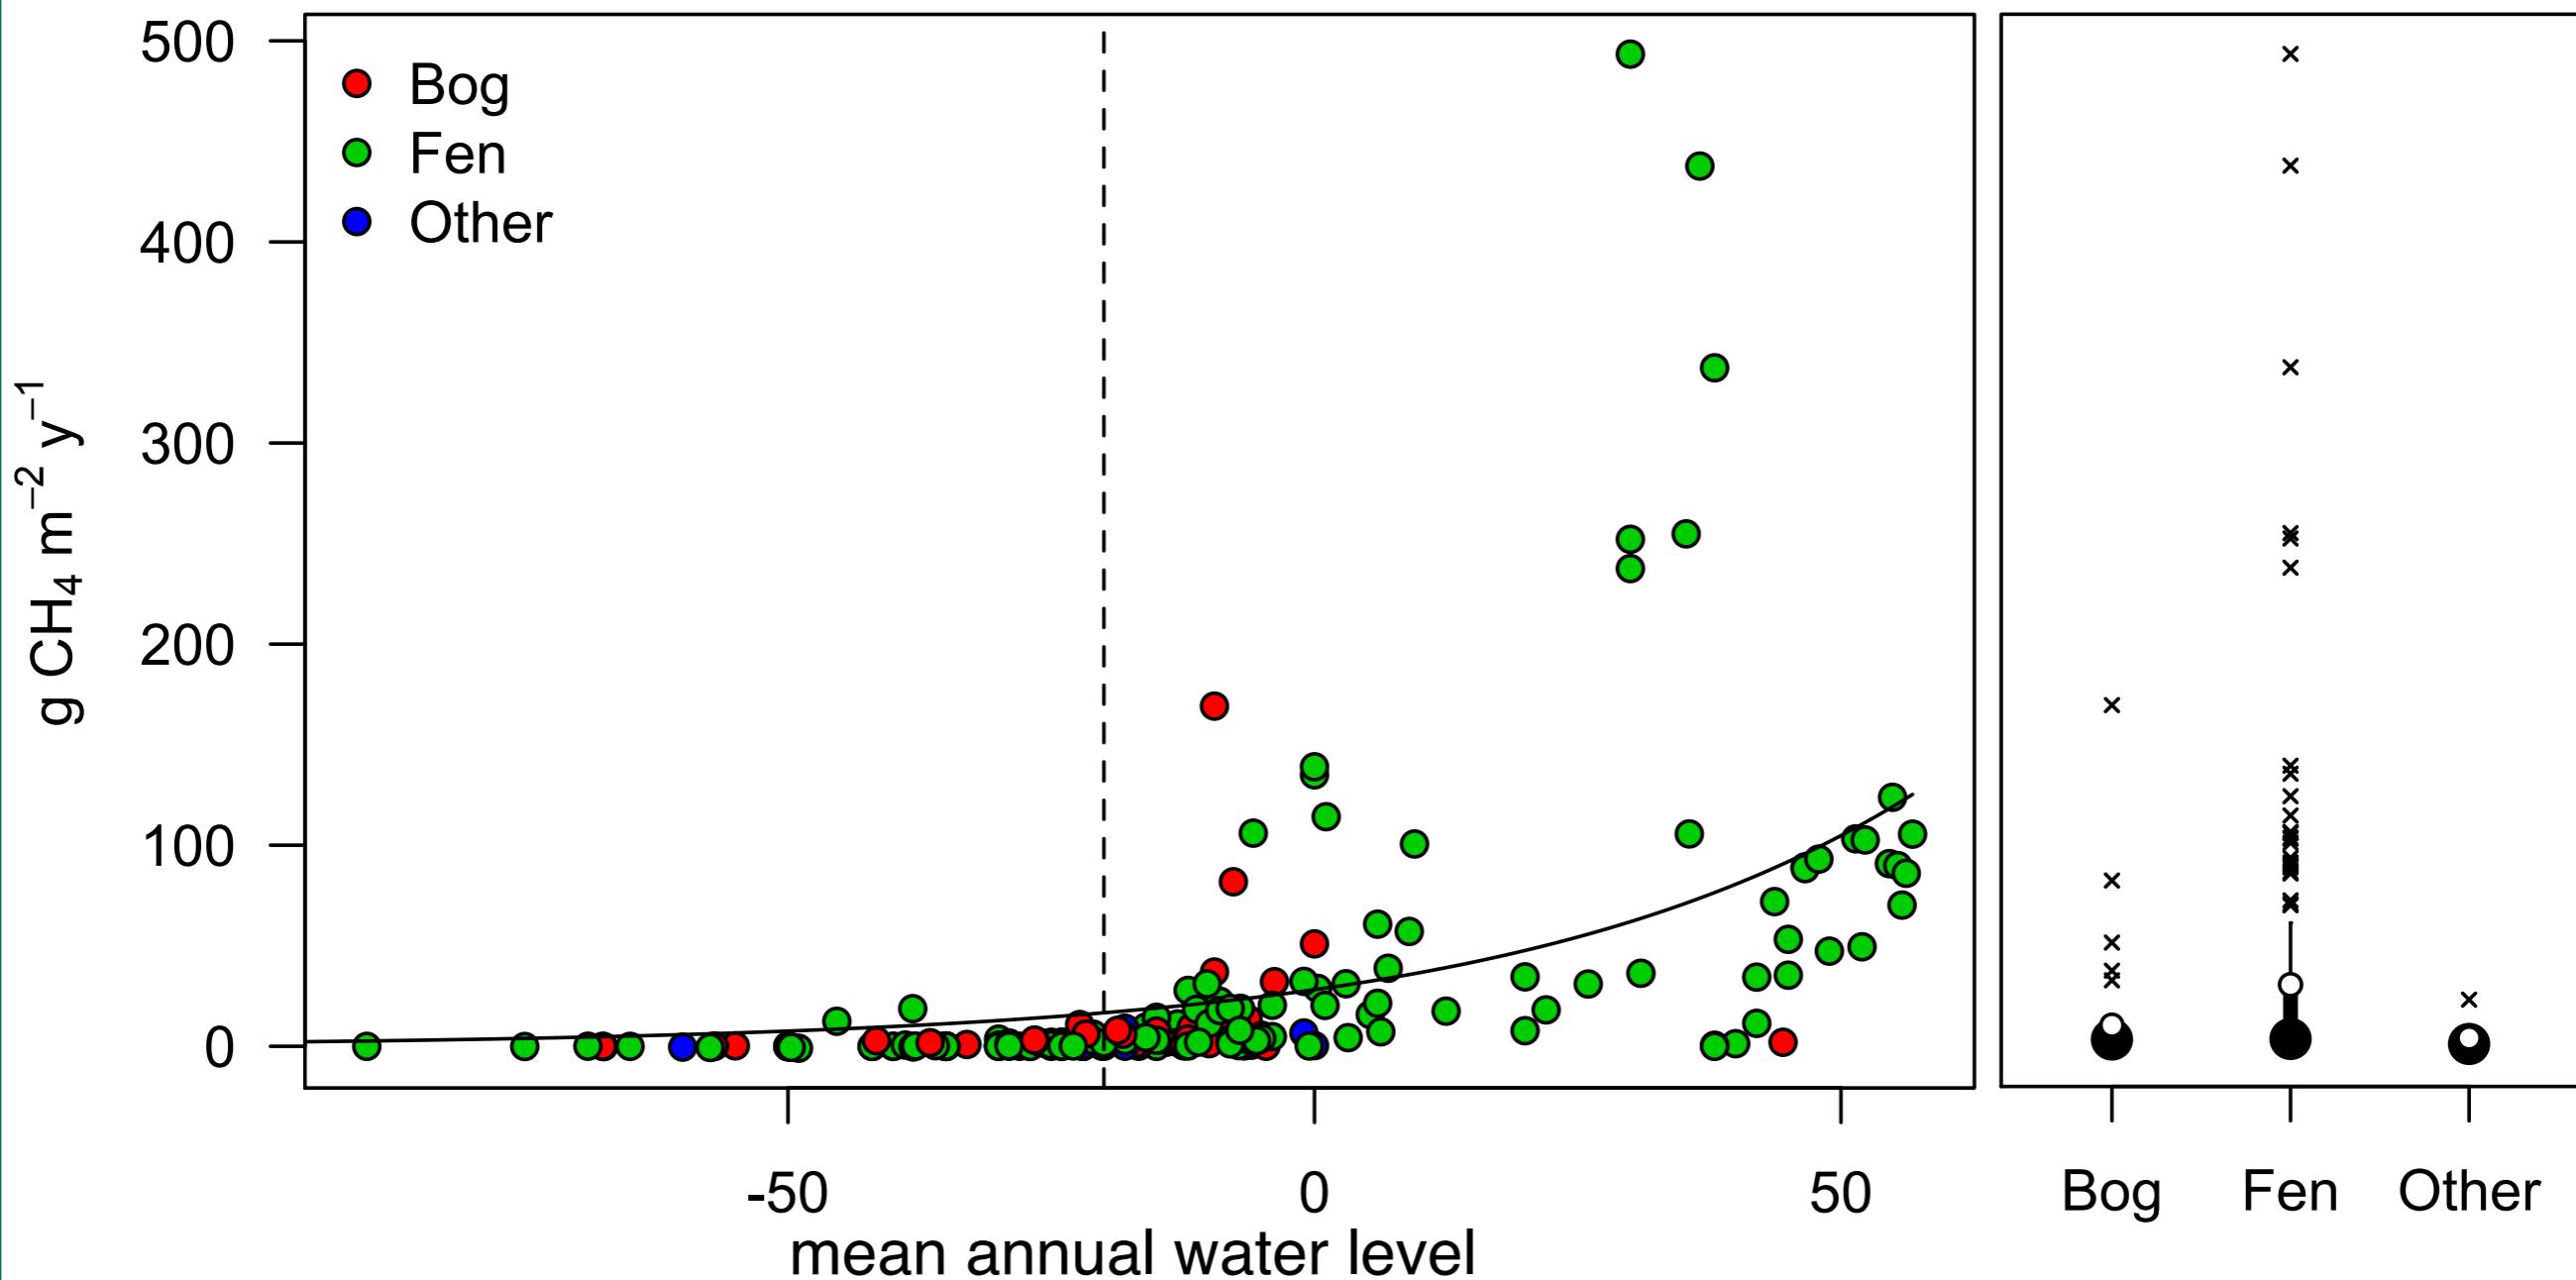

# $\text{CH}_4$ exchange is driven by water level across peatland types

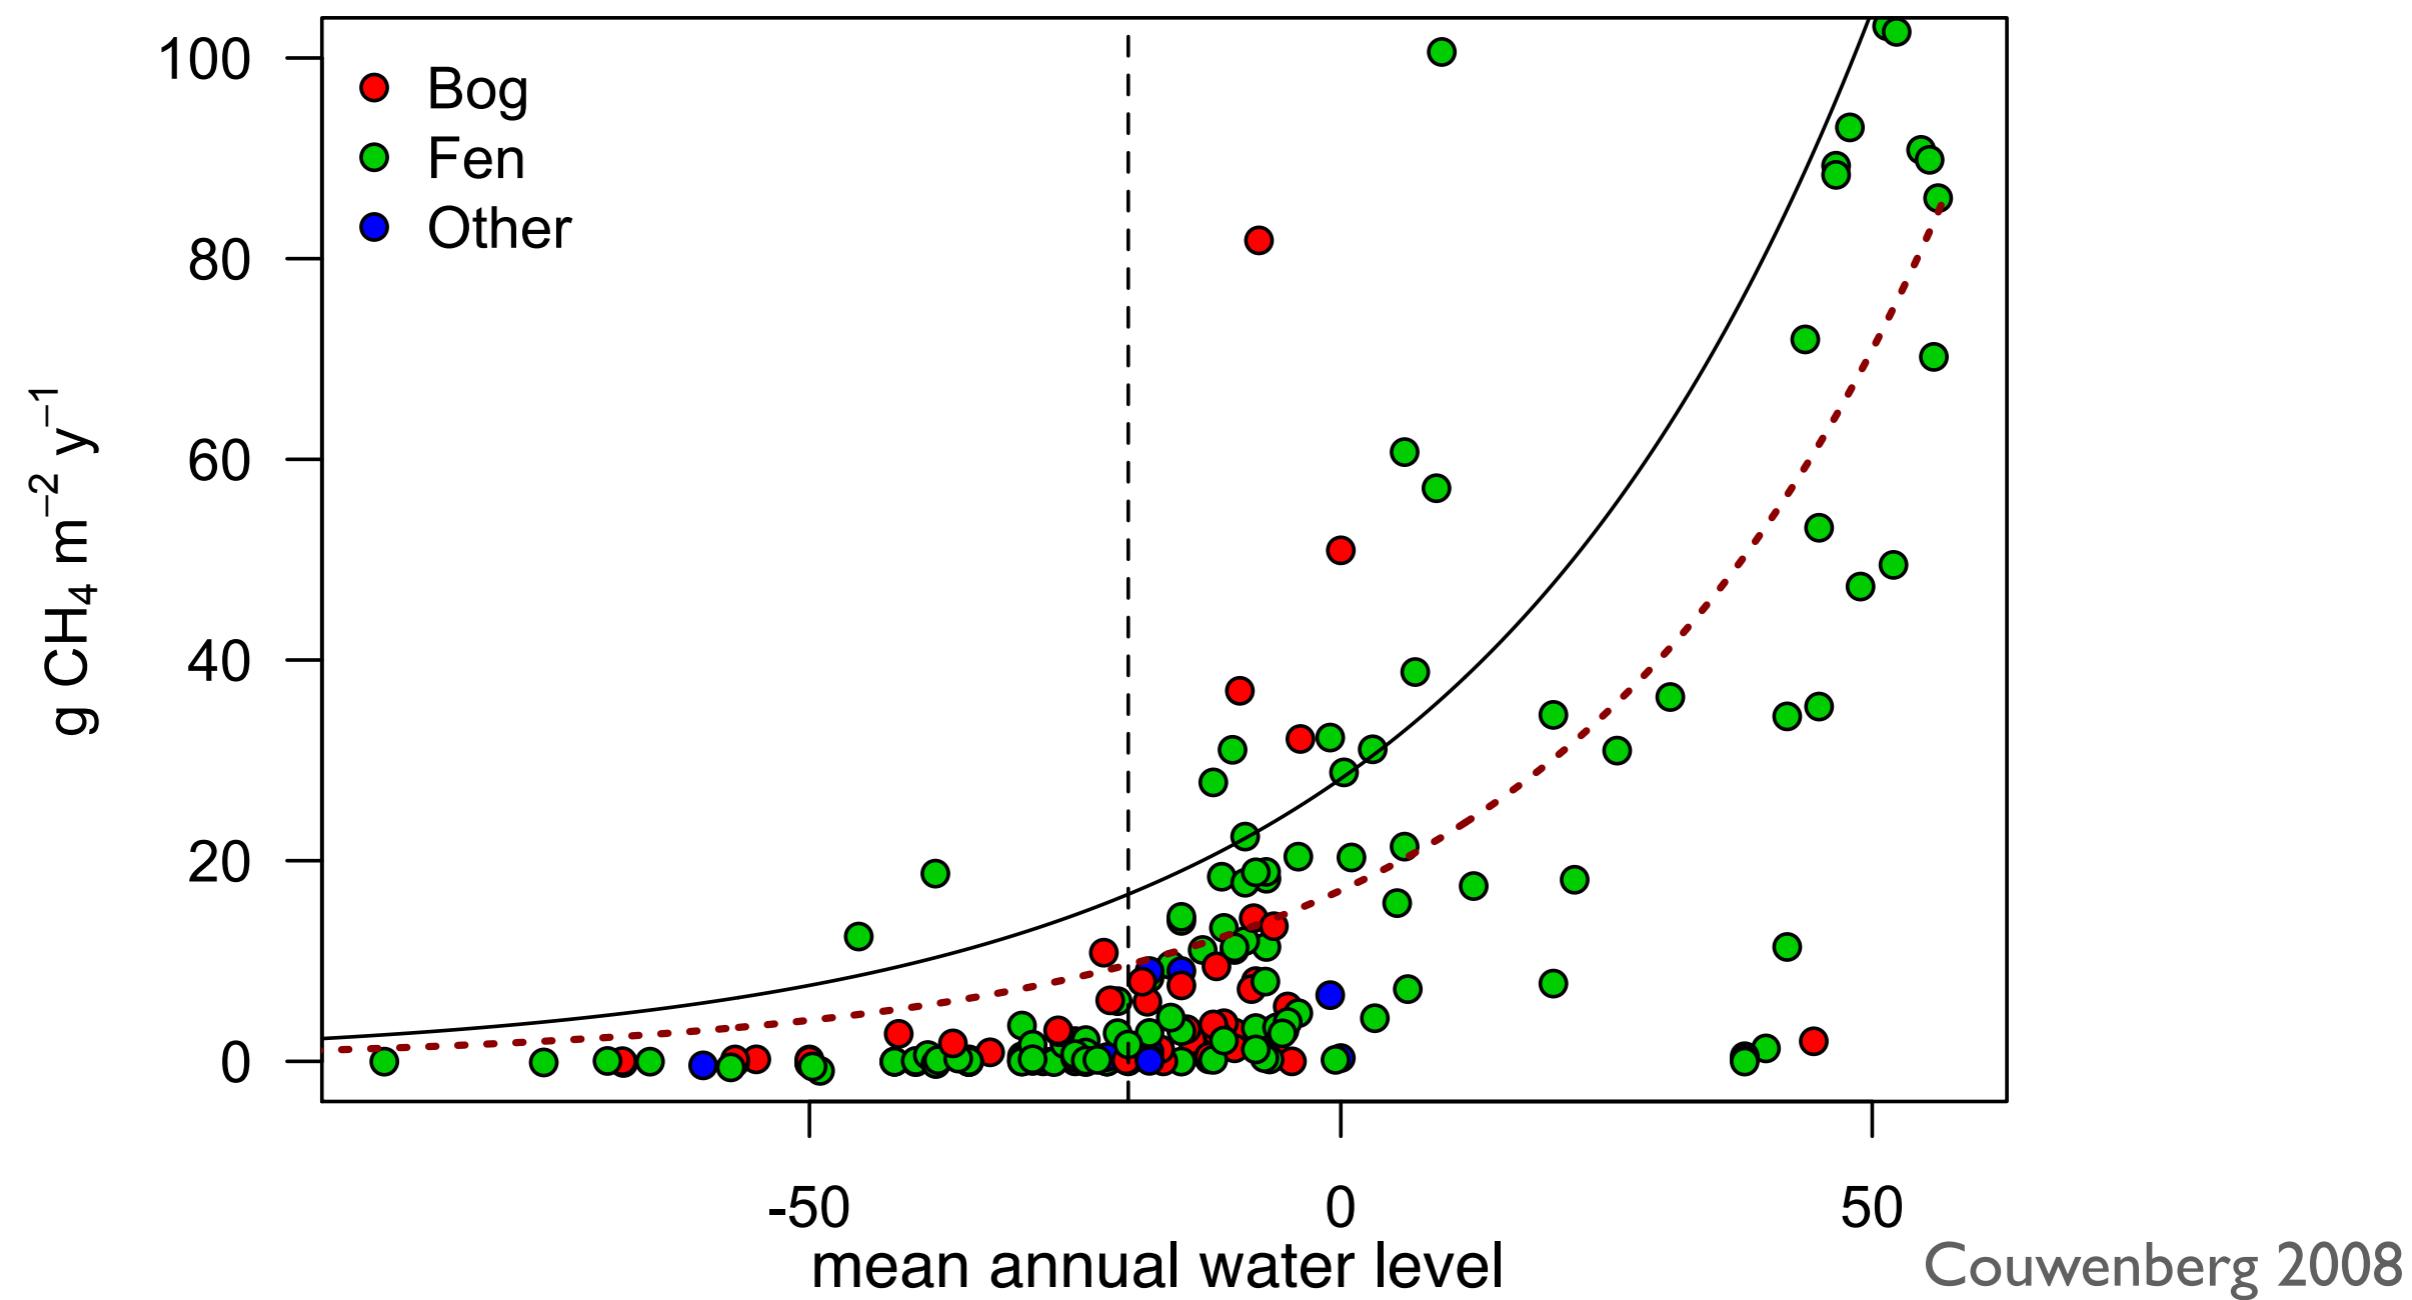

# $\text{CH}_4$ exchange – also with more data the –20cm switch remains apparent

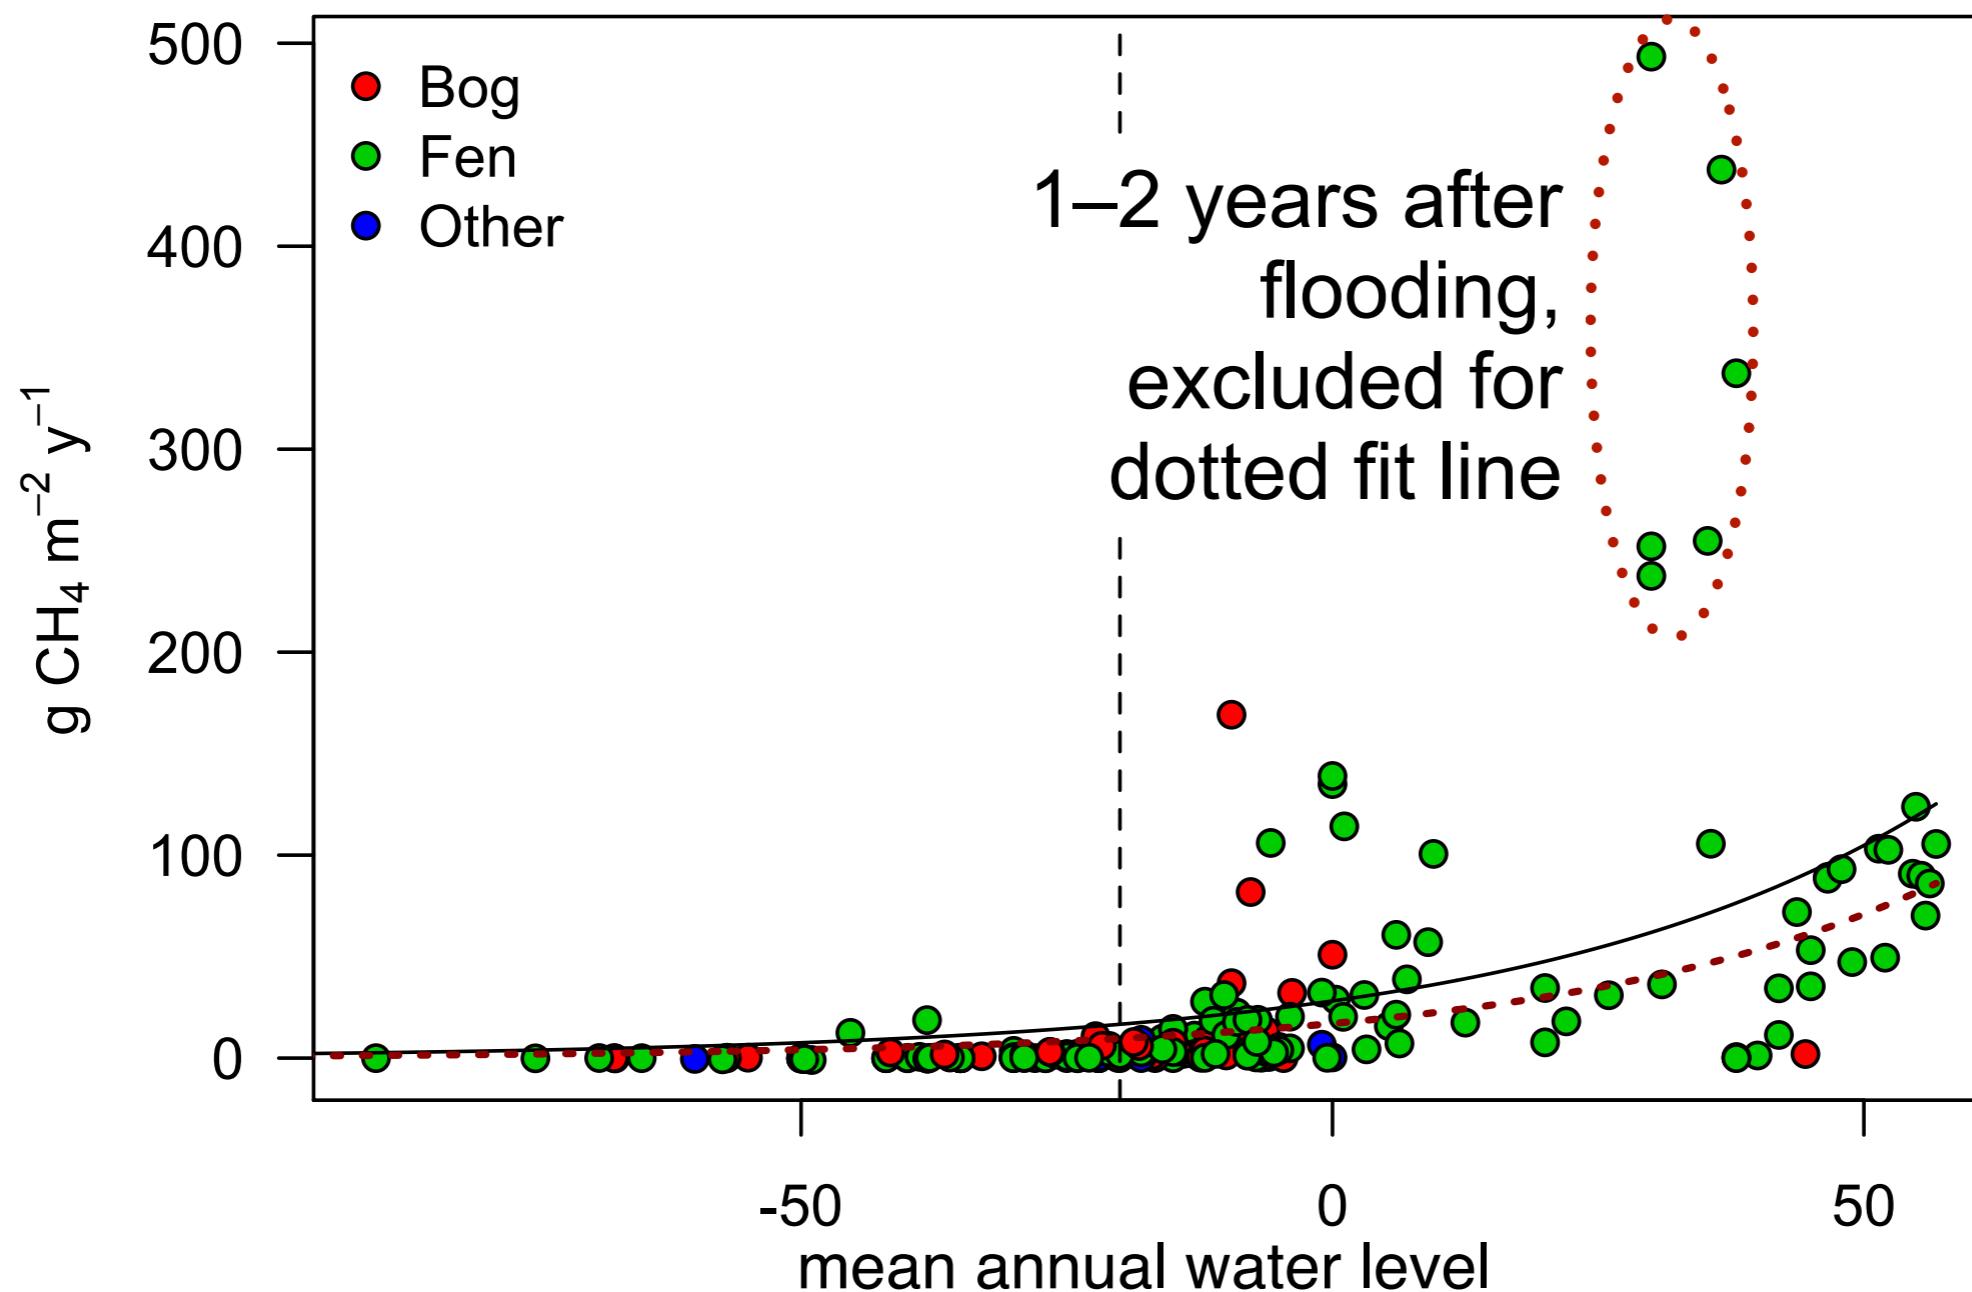

# CH<sub>4</sub> exchange: the -20cm switch gets blurry when zooming in – a lower fit seems more appropriate

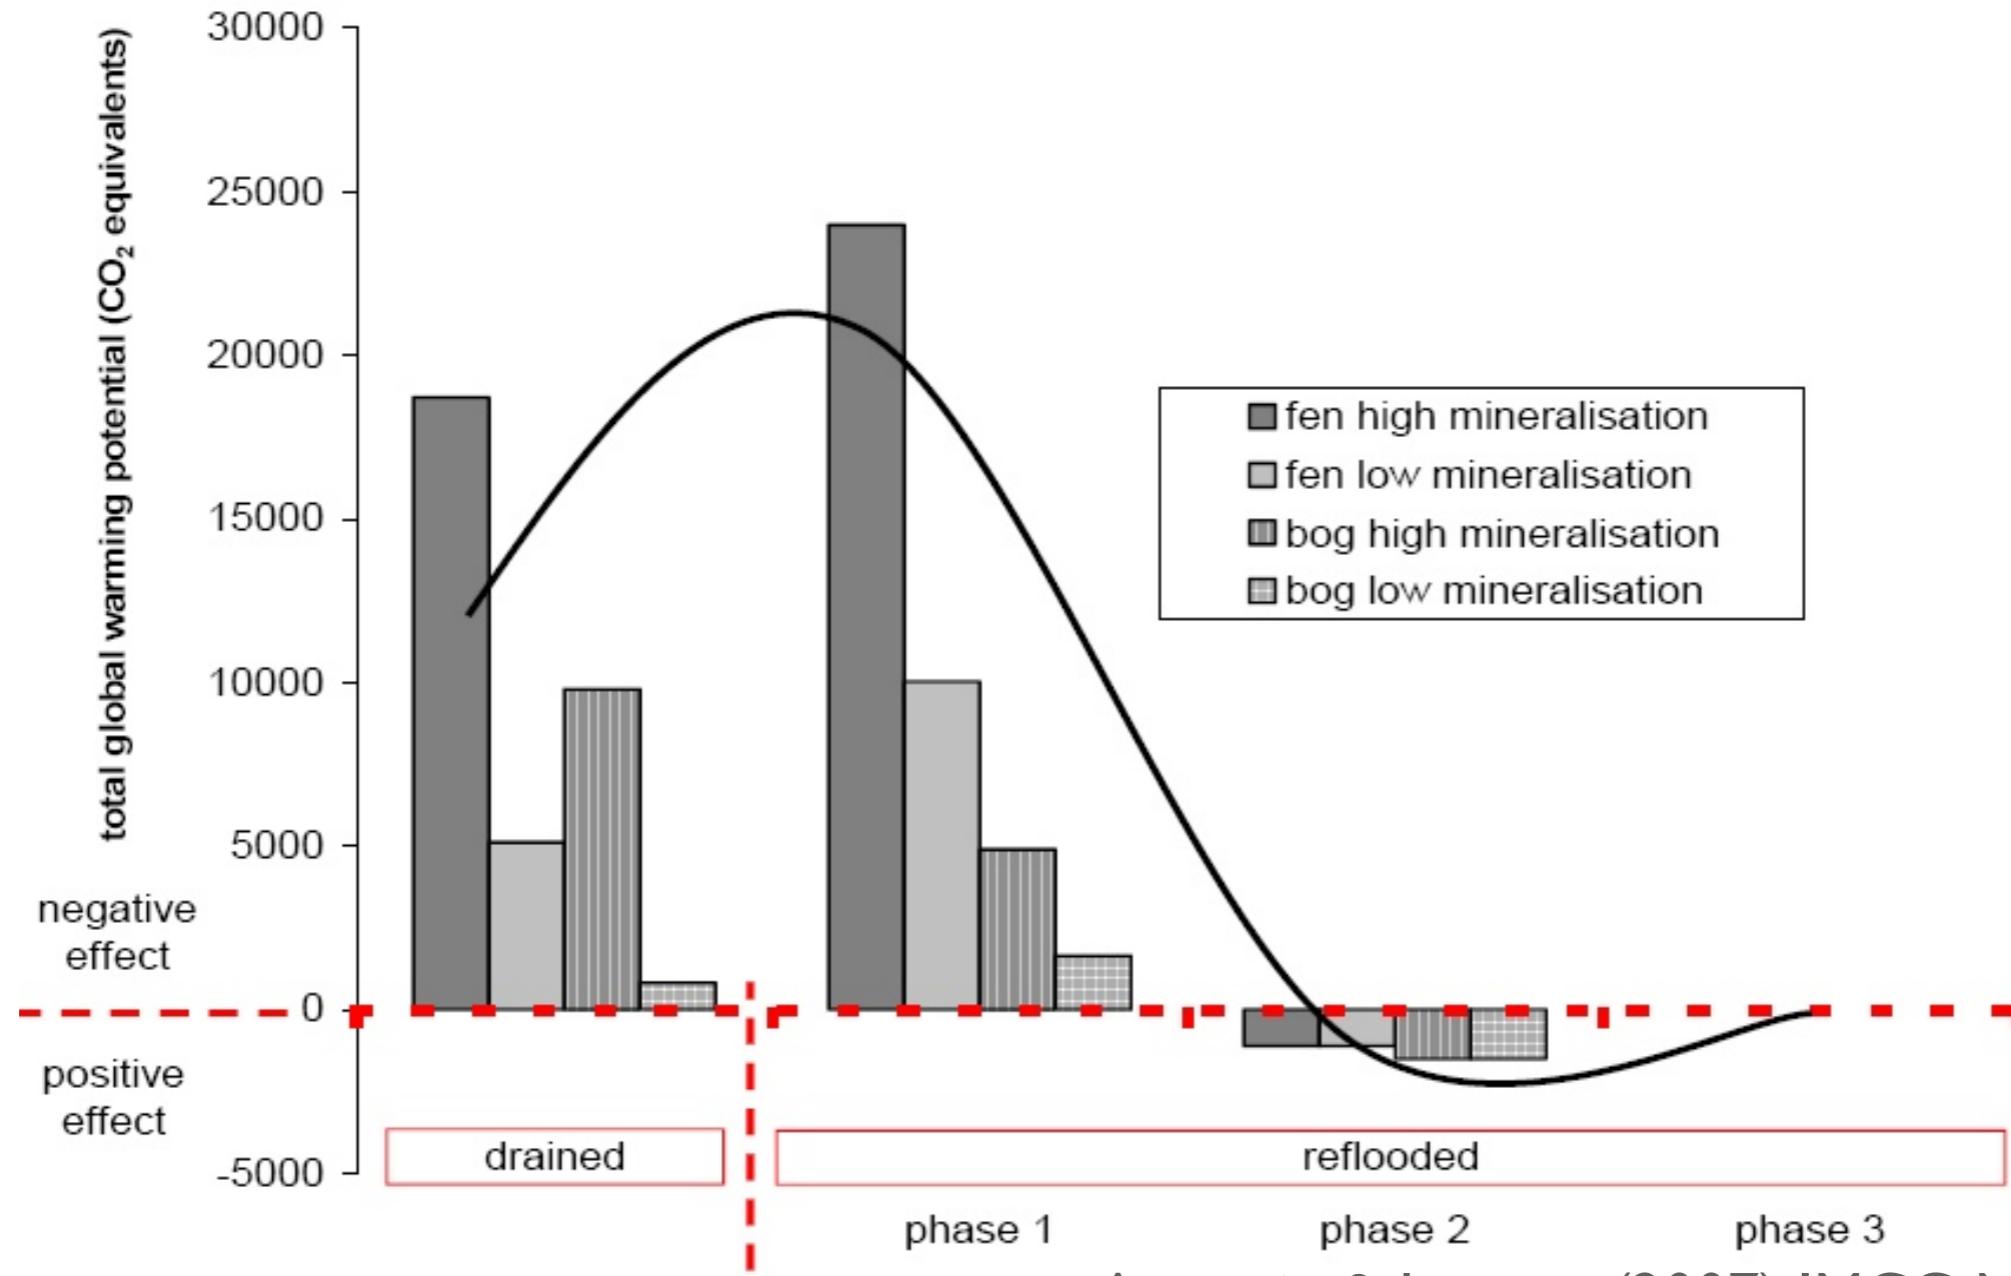

# Very high CH<sub>4</sub> emissions may occur shortly after flooding hypertrophic fens

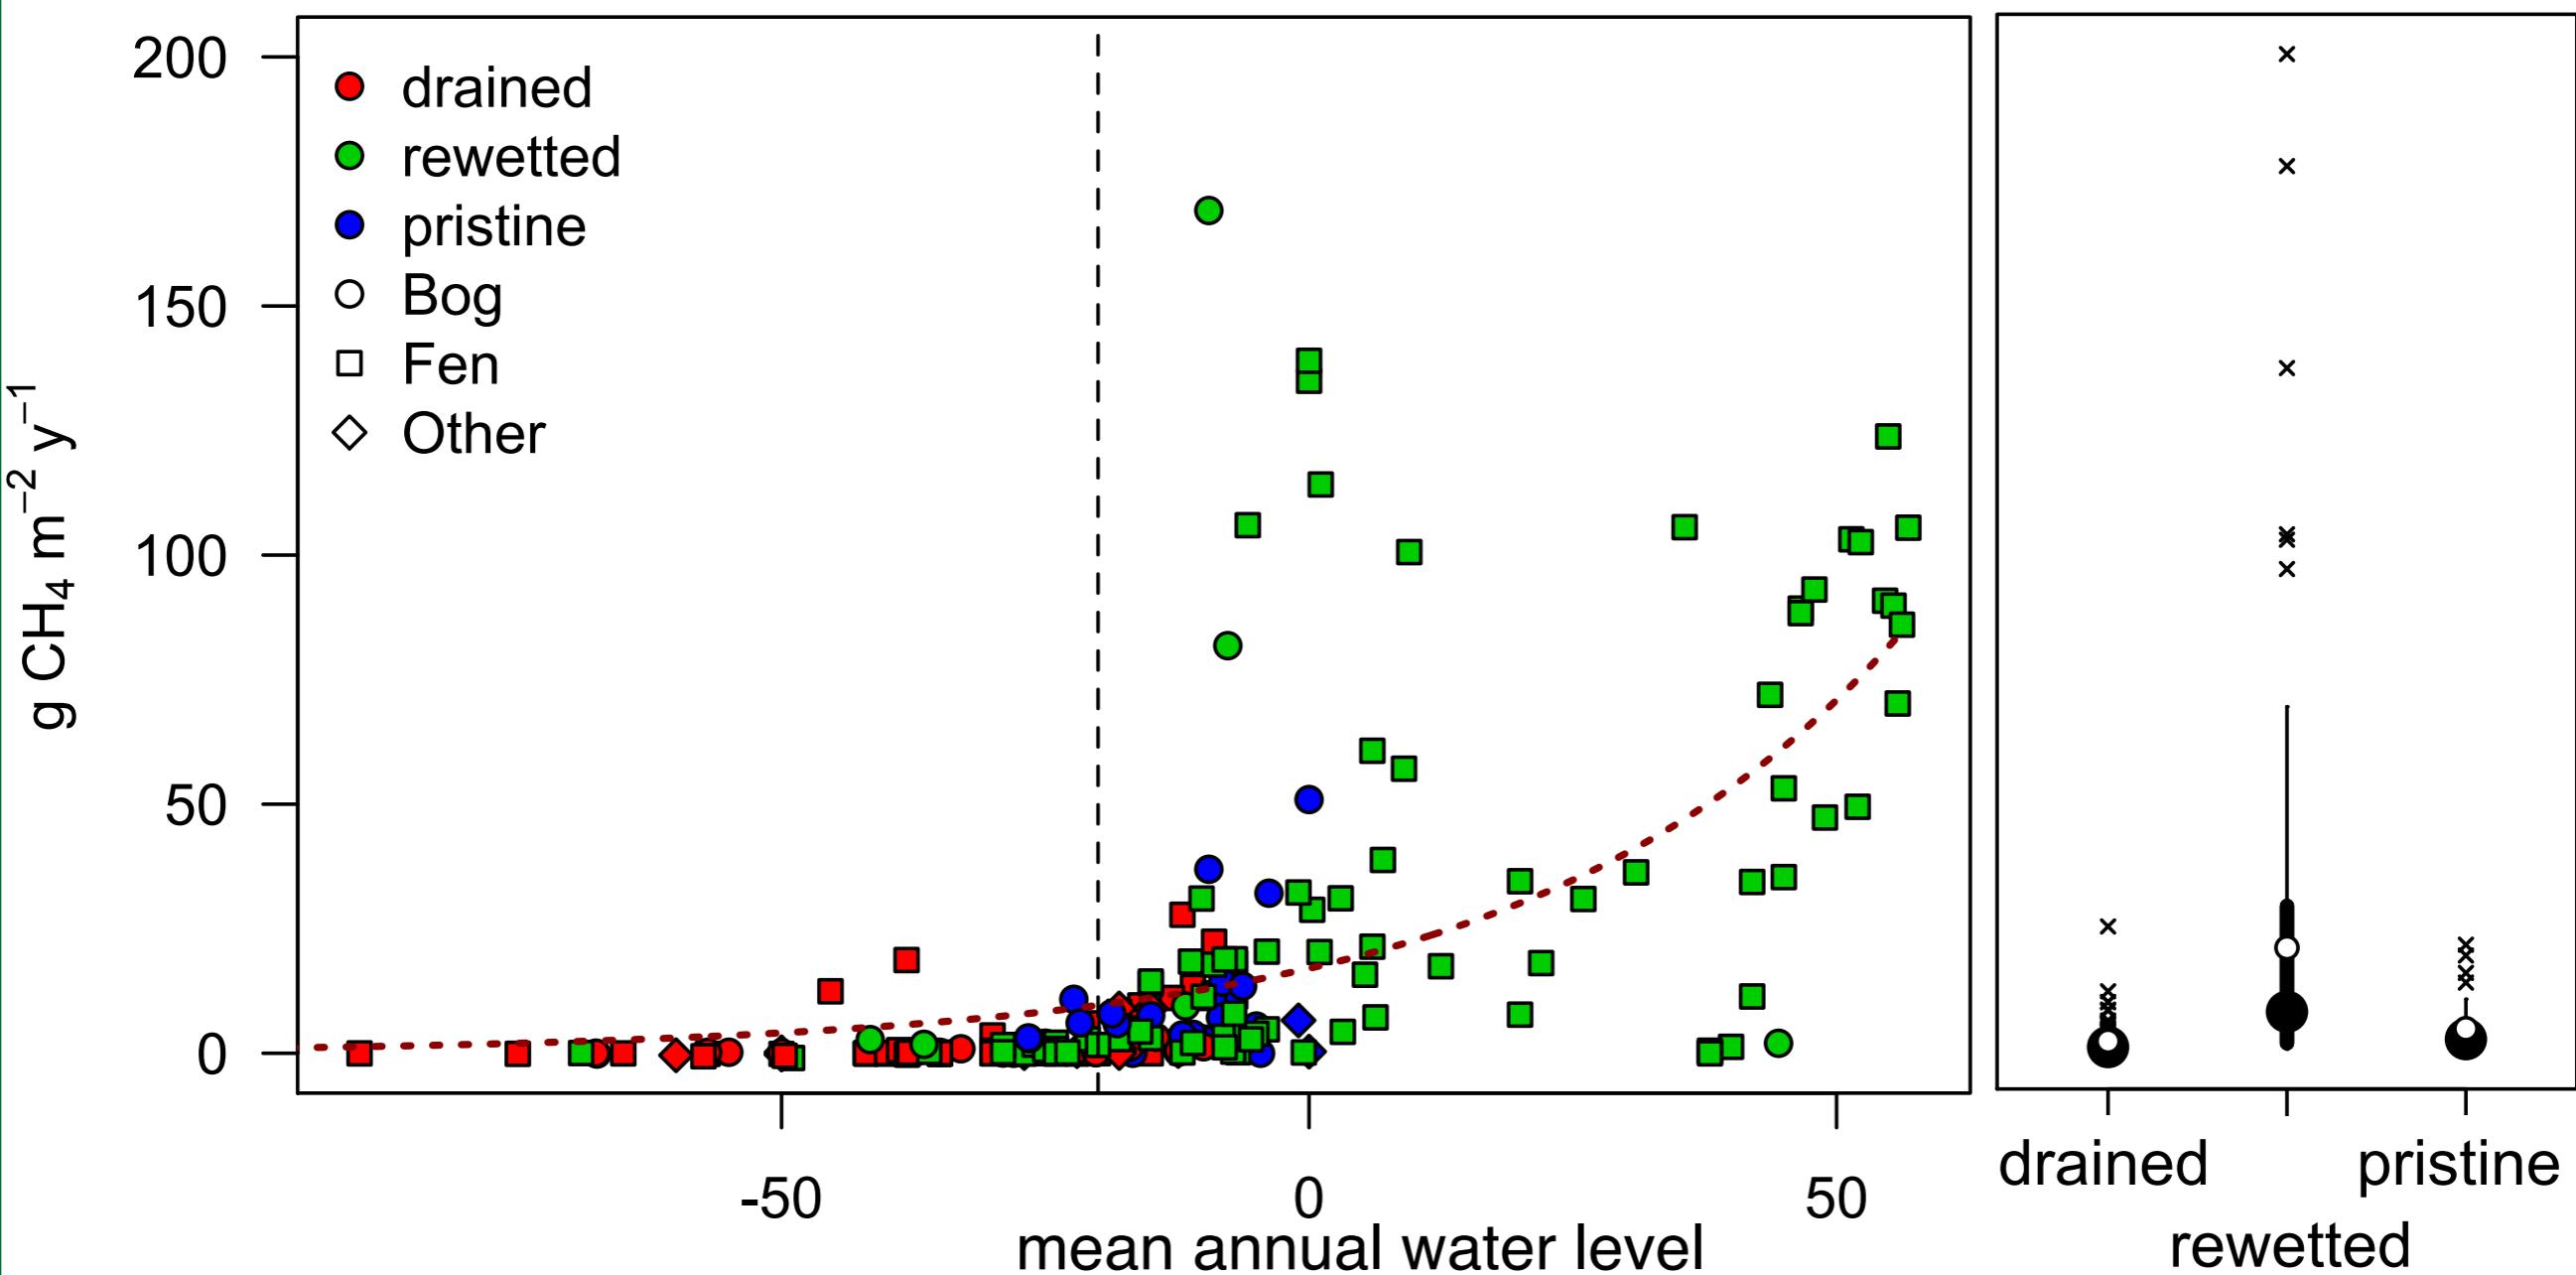

# High CH<sub>4</sub> emissions after rewetting are reported from hypertrophic German fens

Augustin & Joosten (2007) IMCG Newsletter

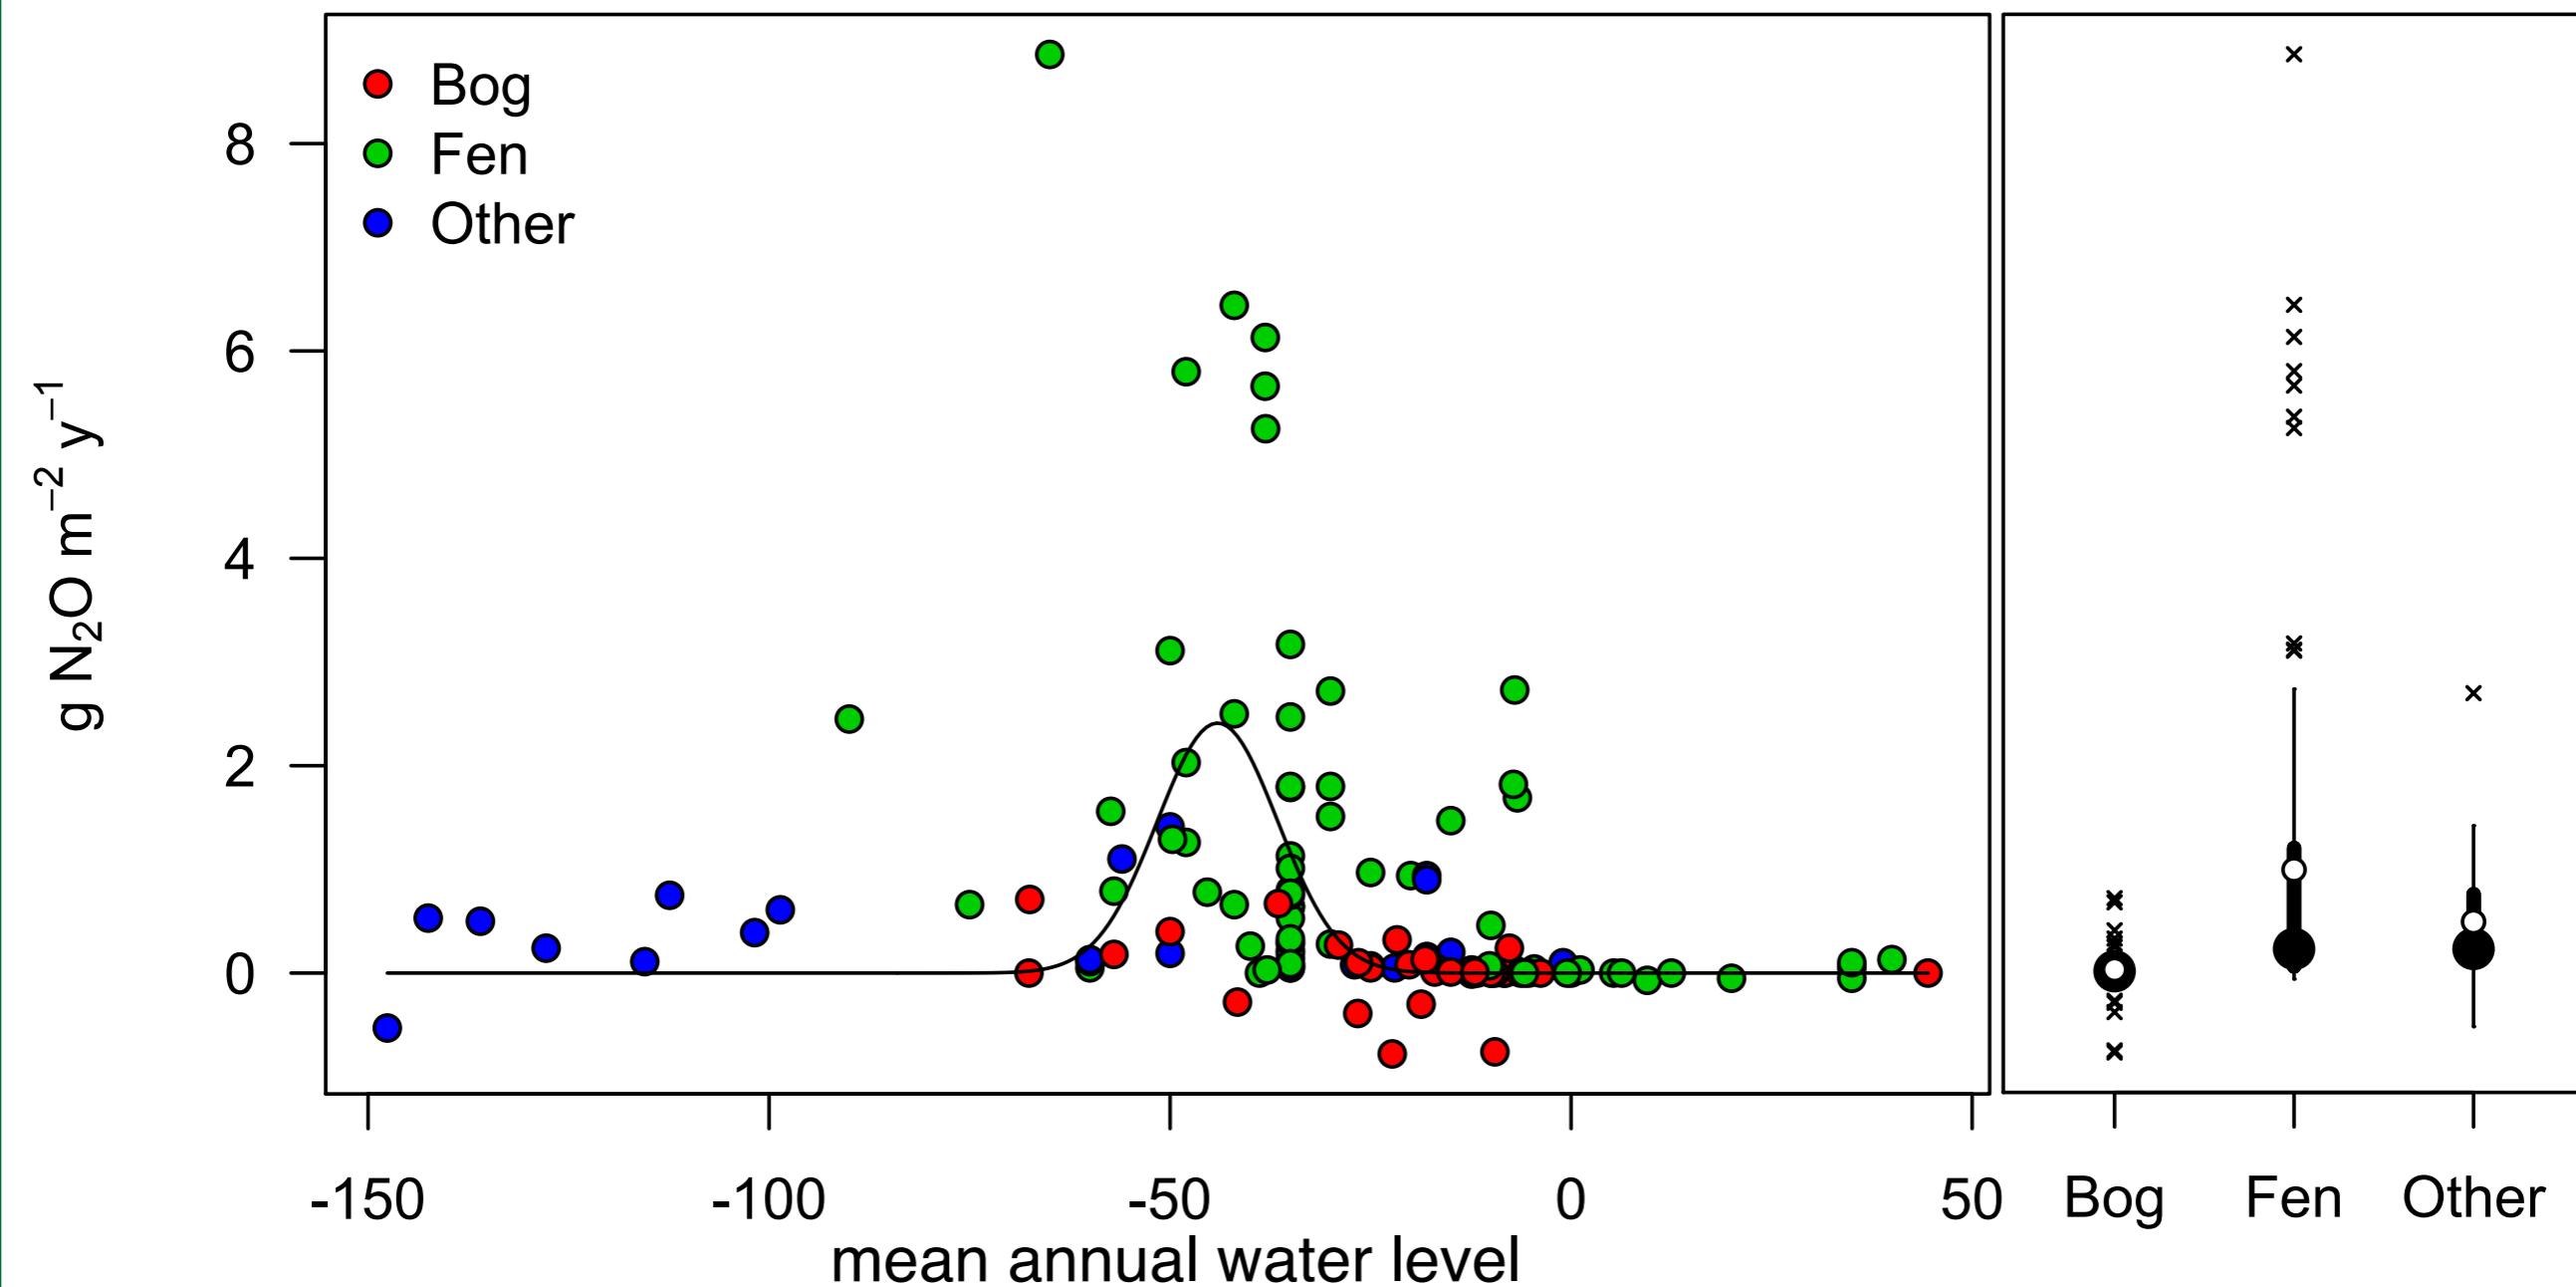

Omitting very high  $\text{CH}_4$  emissions that occur shortly after rewetting hypertrophic fens leads to better fit

# $\text{N}_2\text{O}$ emissions higher from Fens – an optimum model can be fit to the data

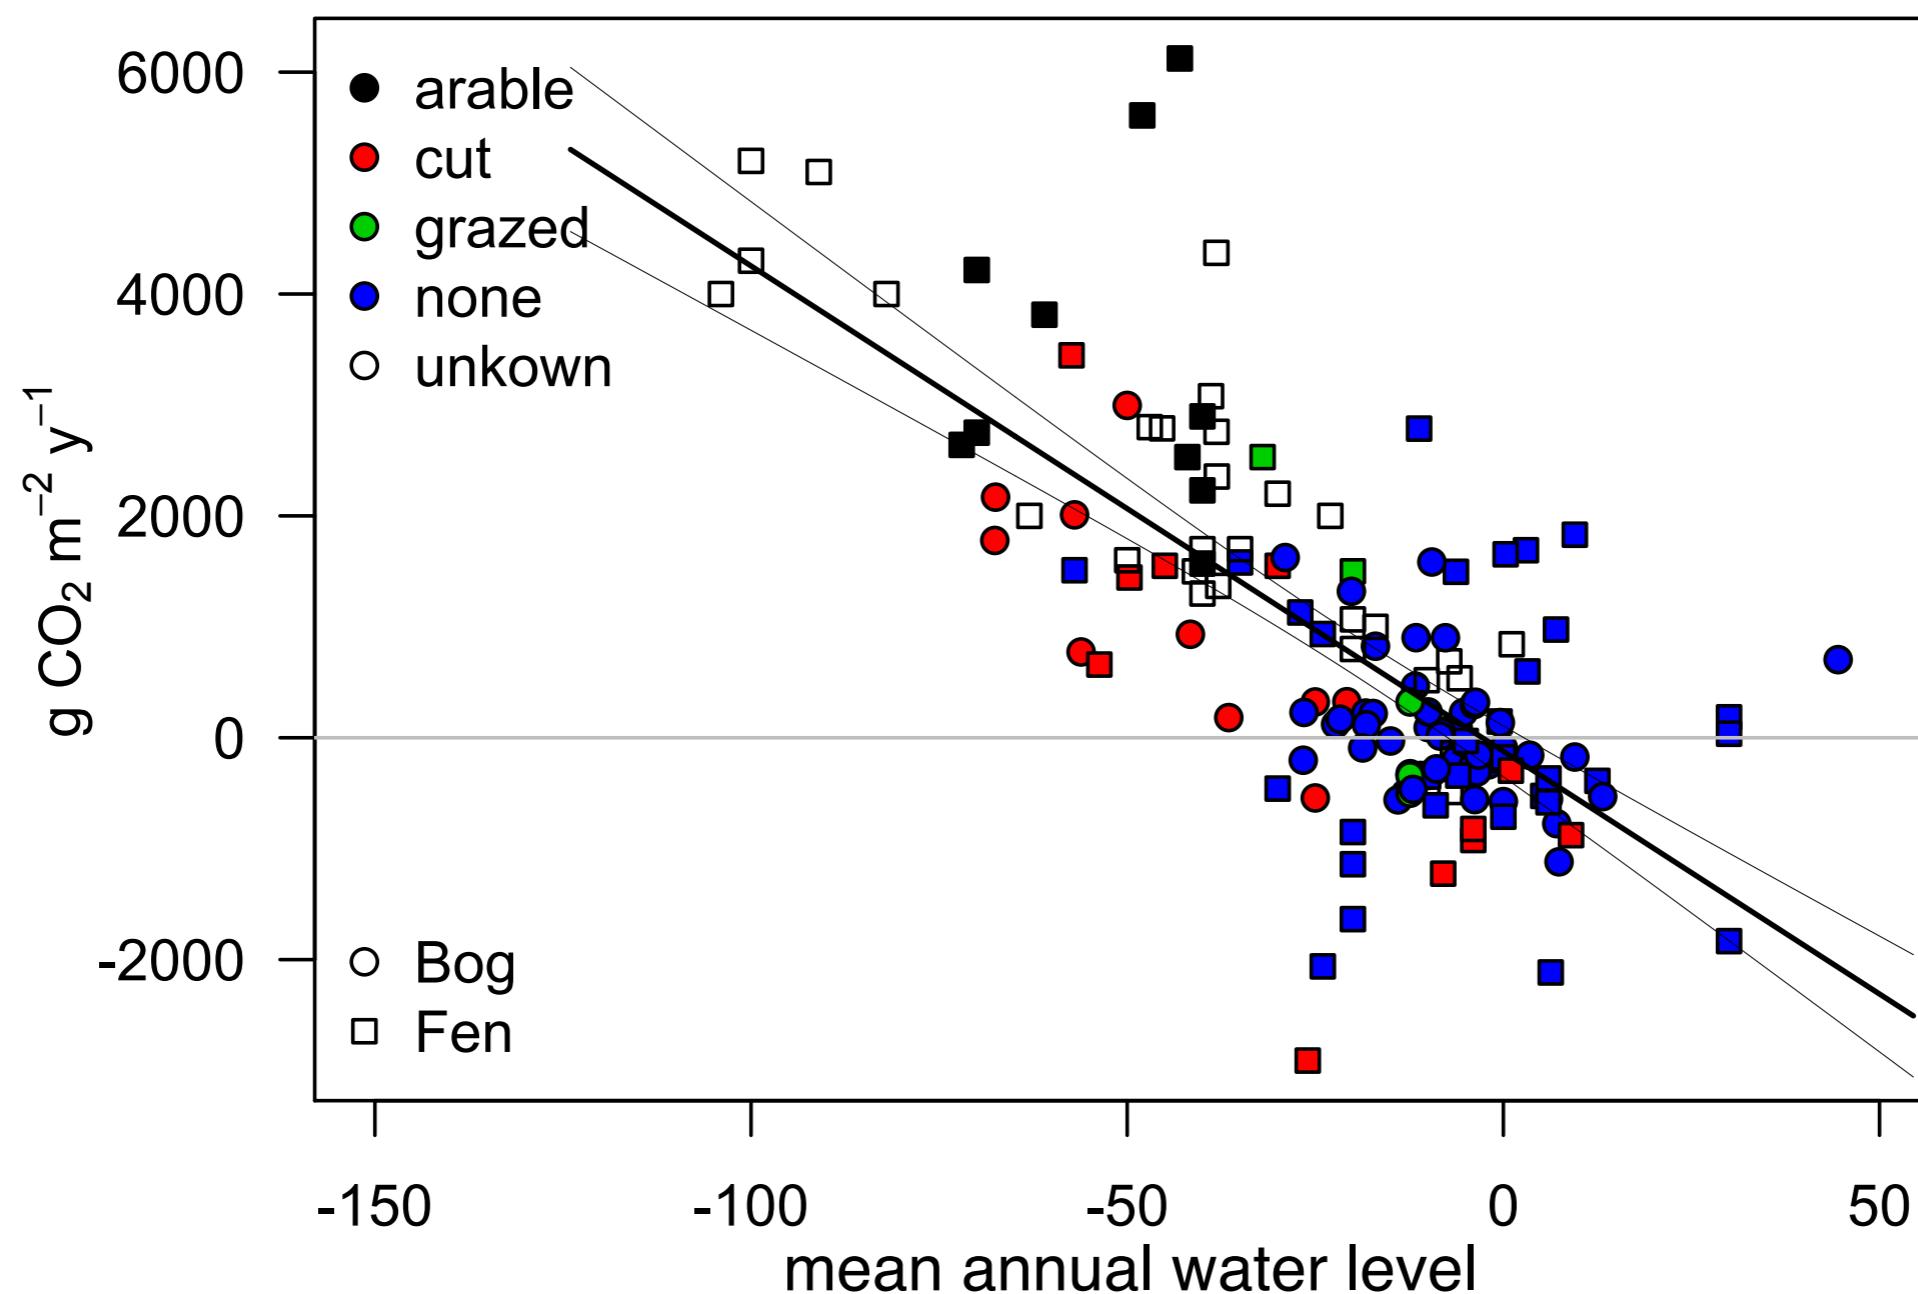

# From the literature – land use may influence GHG emissions from rewetted peatlands

- Data regarding land use effects on rewetted peatlands are sparse (but there are some from pristine peatlands)
- No or a small positive effect of biomass harvest on GHG emissions of sites
- Small or sometimes considerably negative effect of grazing (without incl. the emissions from ruminants) on GHG emissions

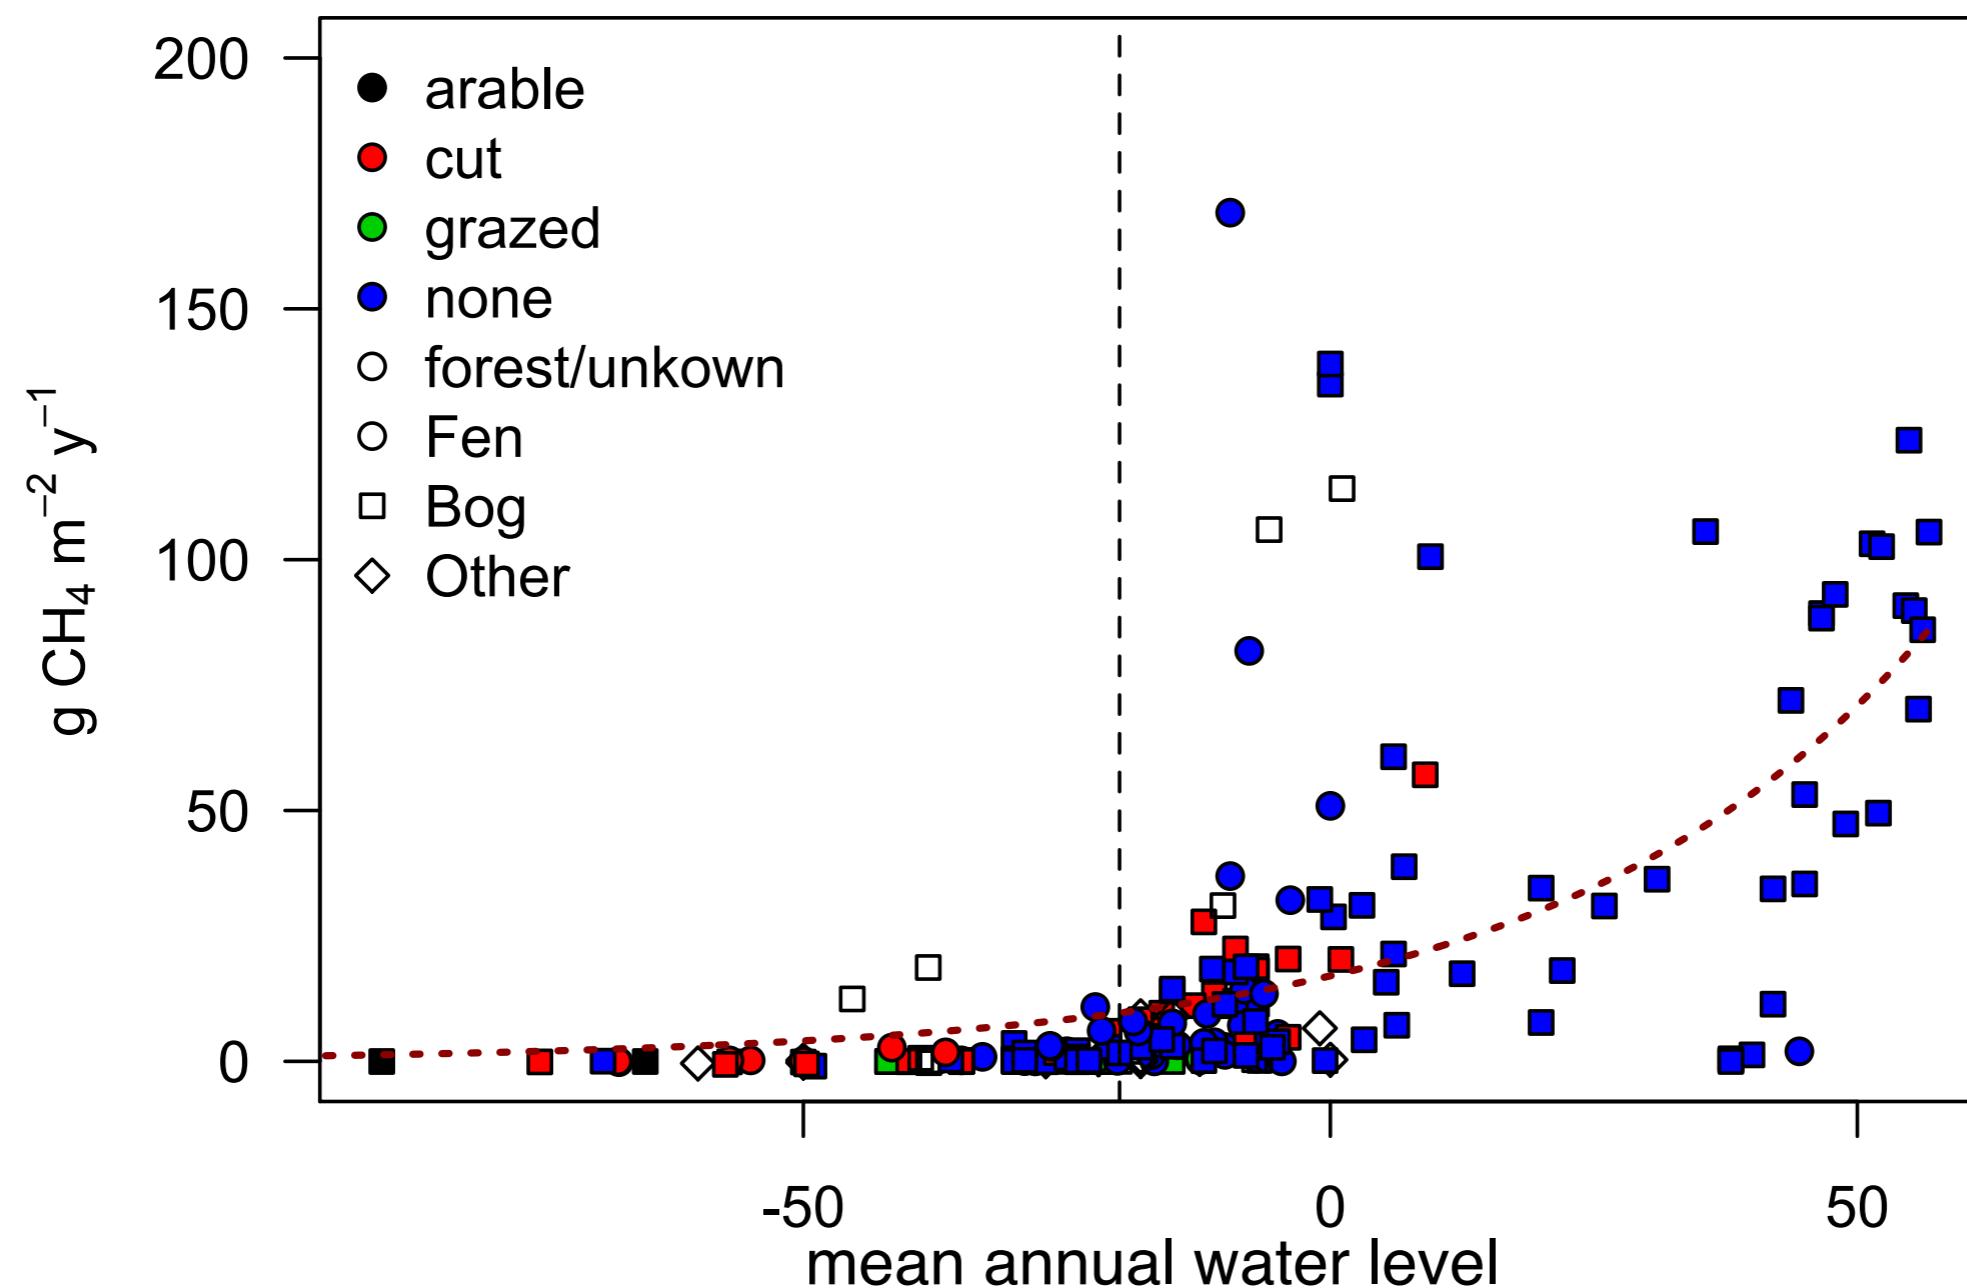

CO<sub>2</sub> emissions are lower at same water levels under biomass harvest compared to no use

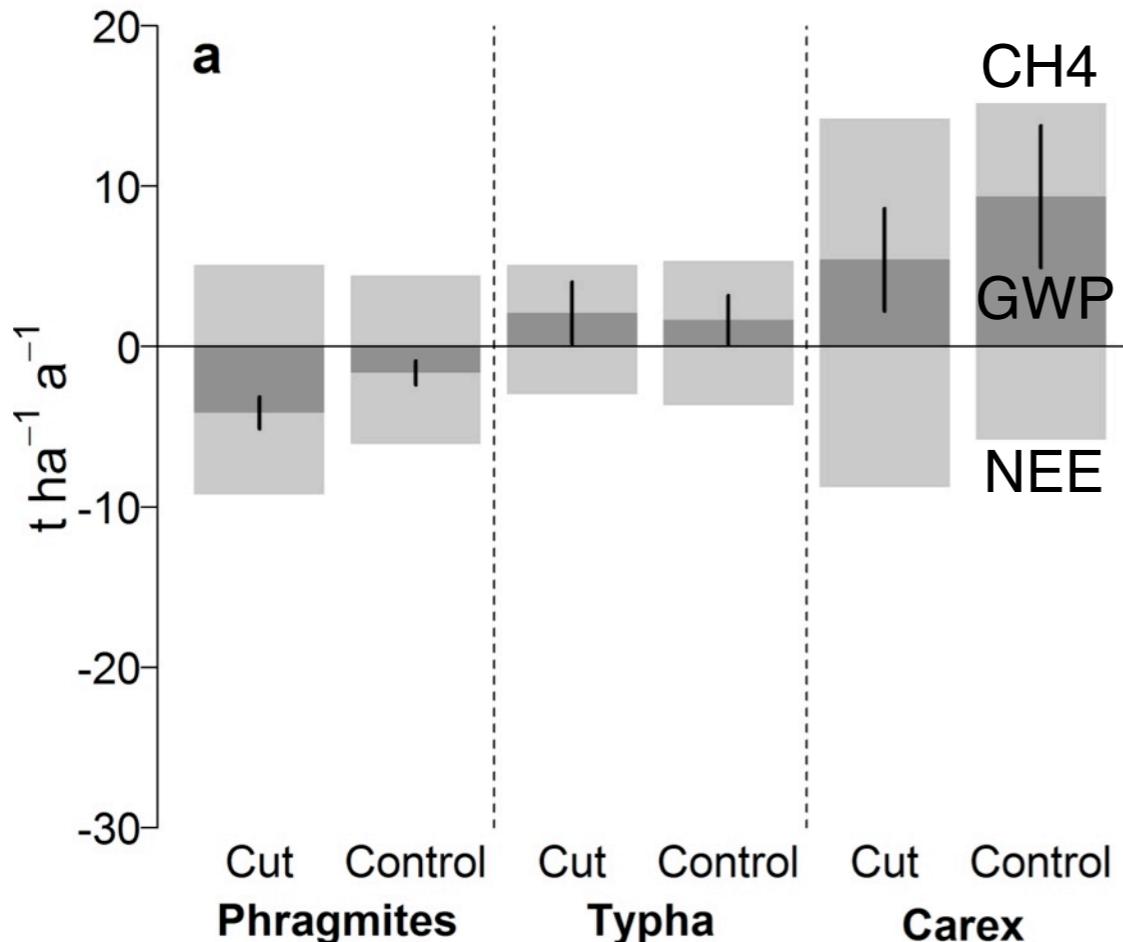

# High methane emissions from not used sites because most rewetting does not involve land use

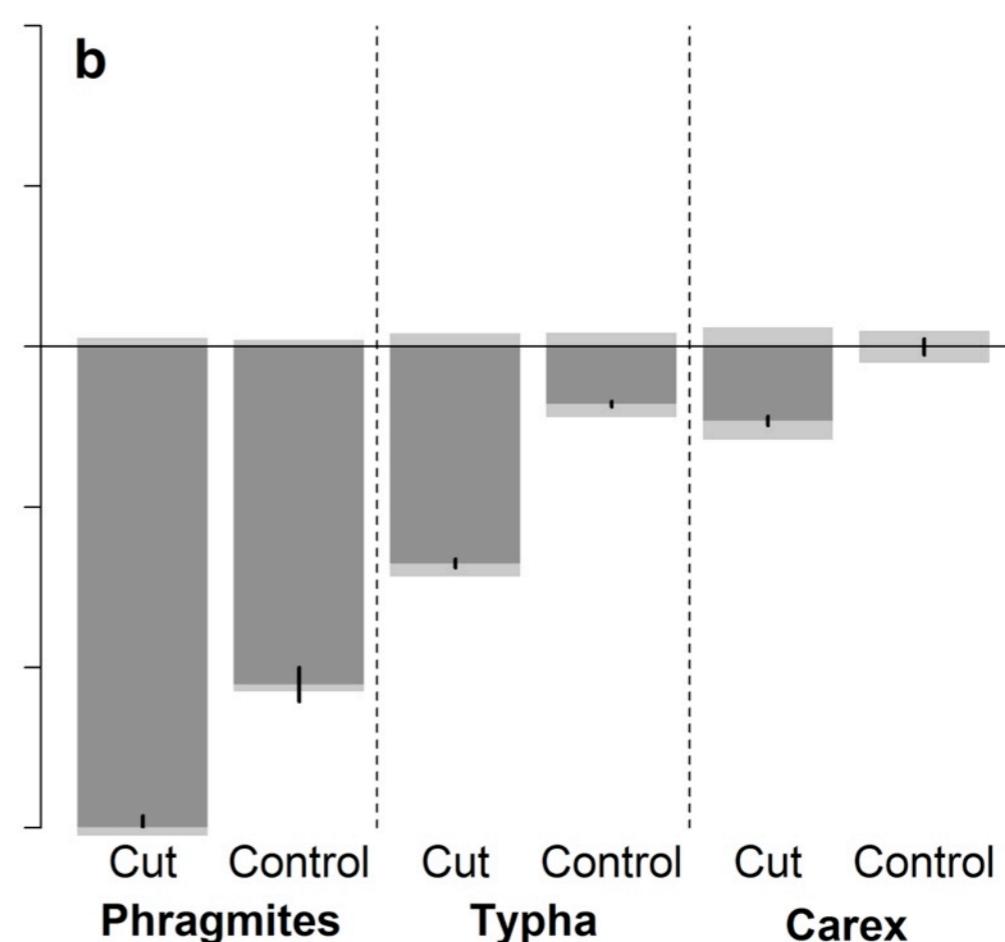

# Experimental cut in VIP project – Cutting does not increase GHG emissions

2011/03 – 2012/03

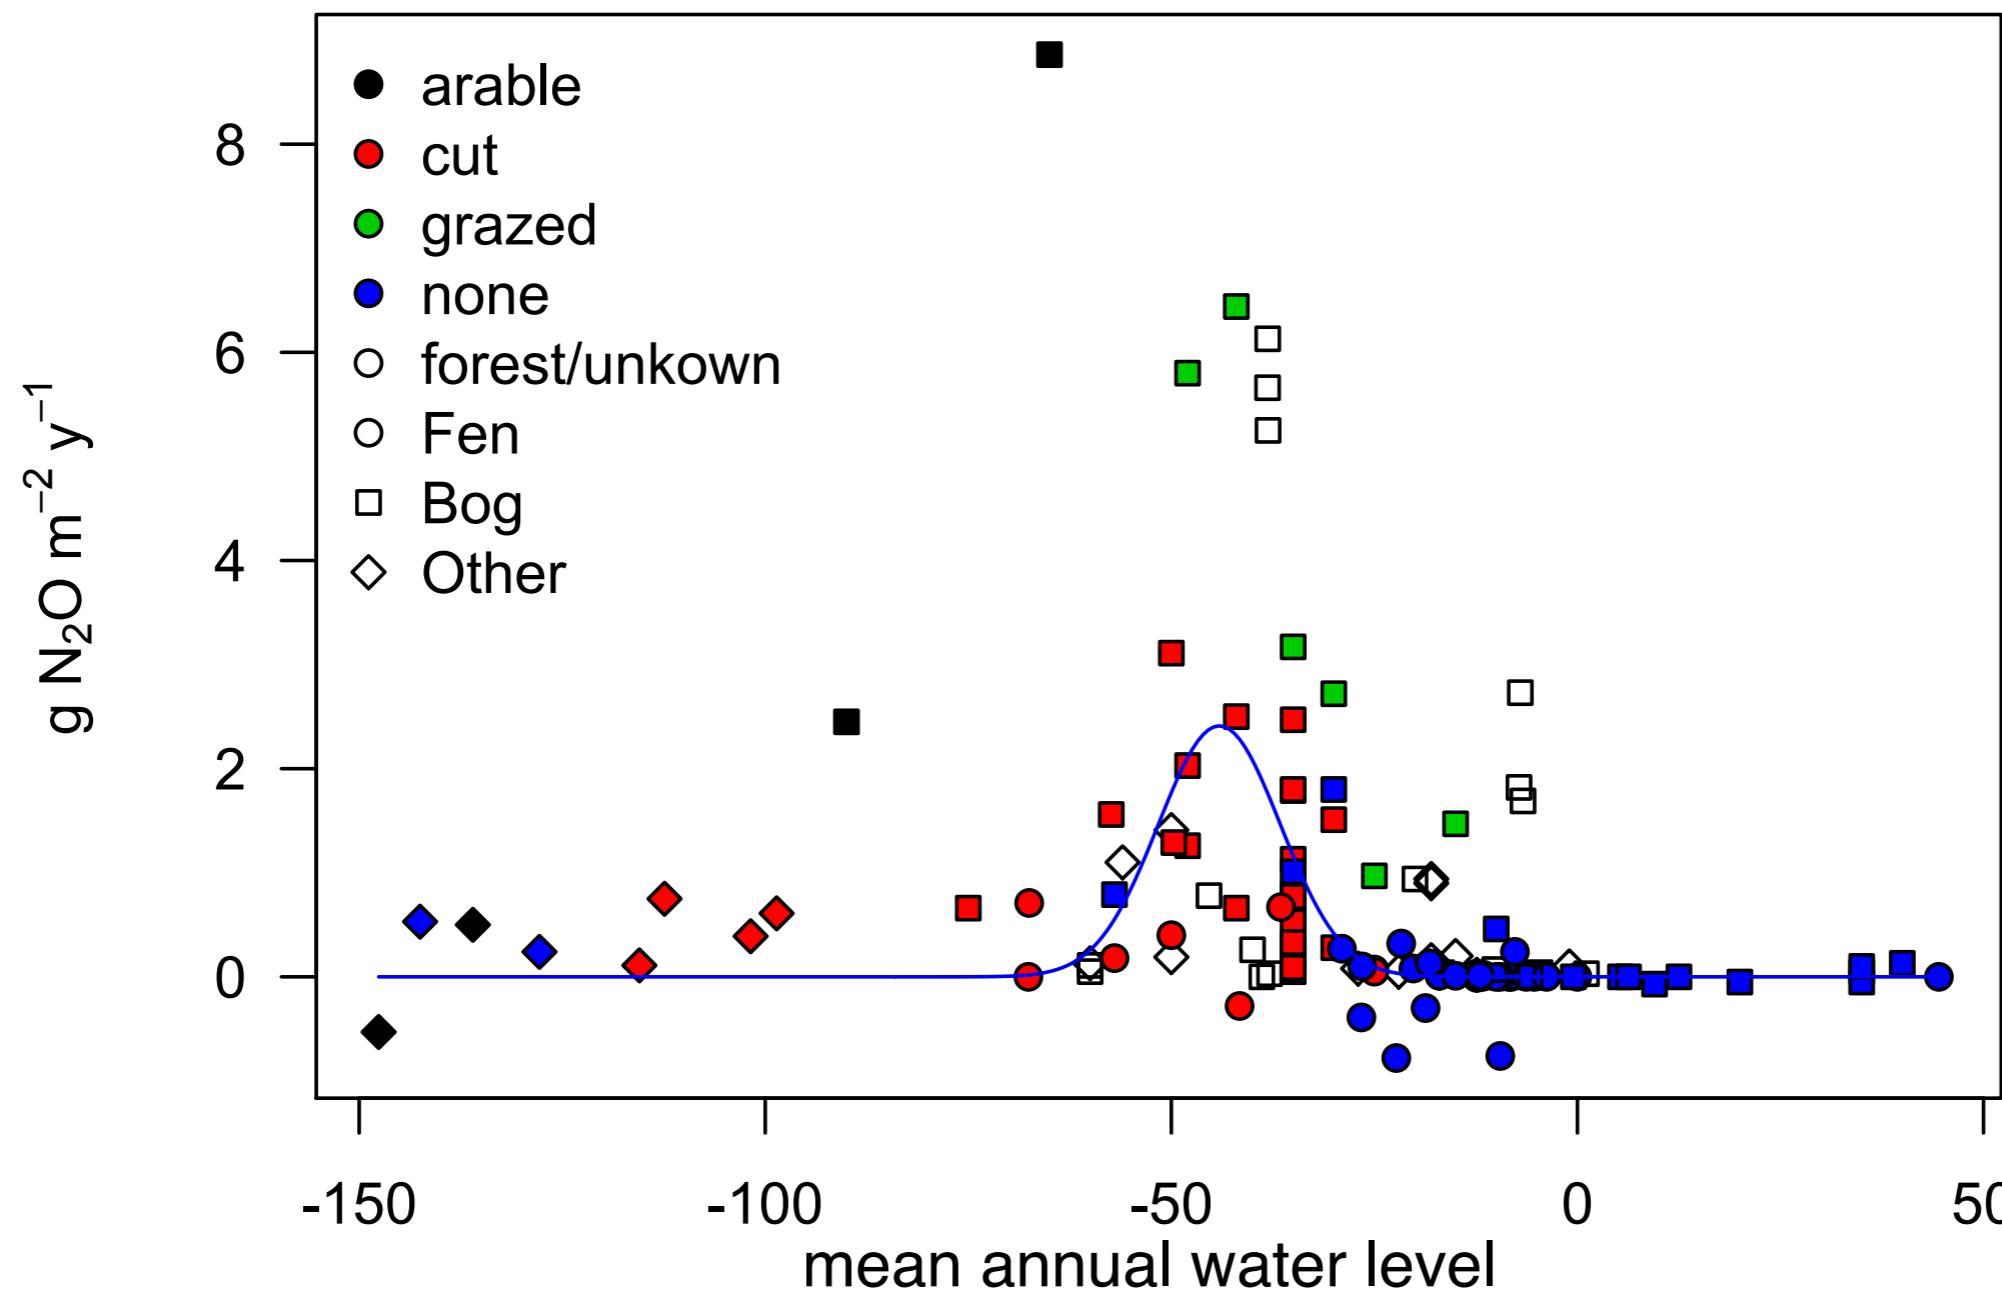

2012/03 – 2012/12

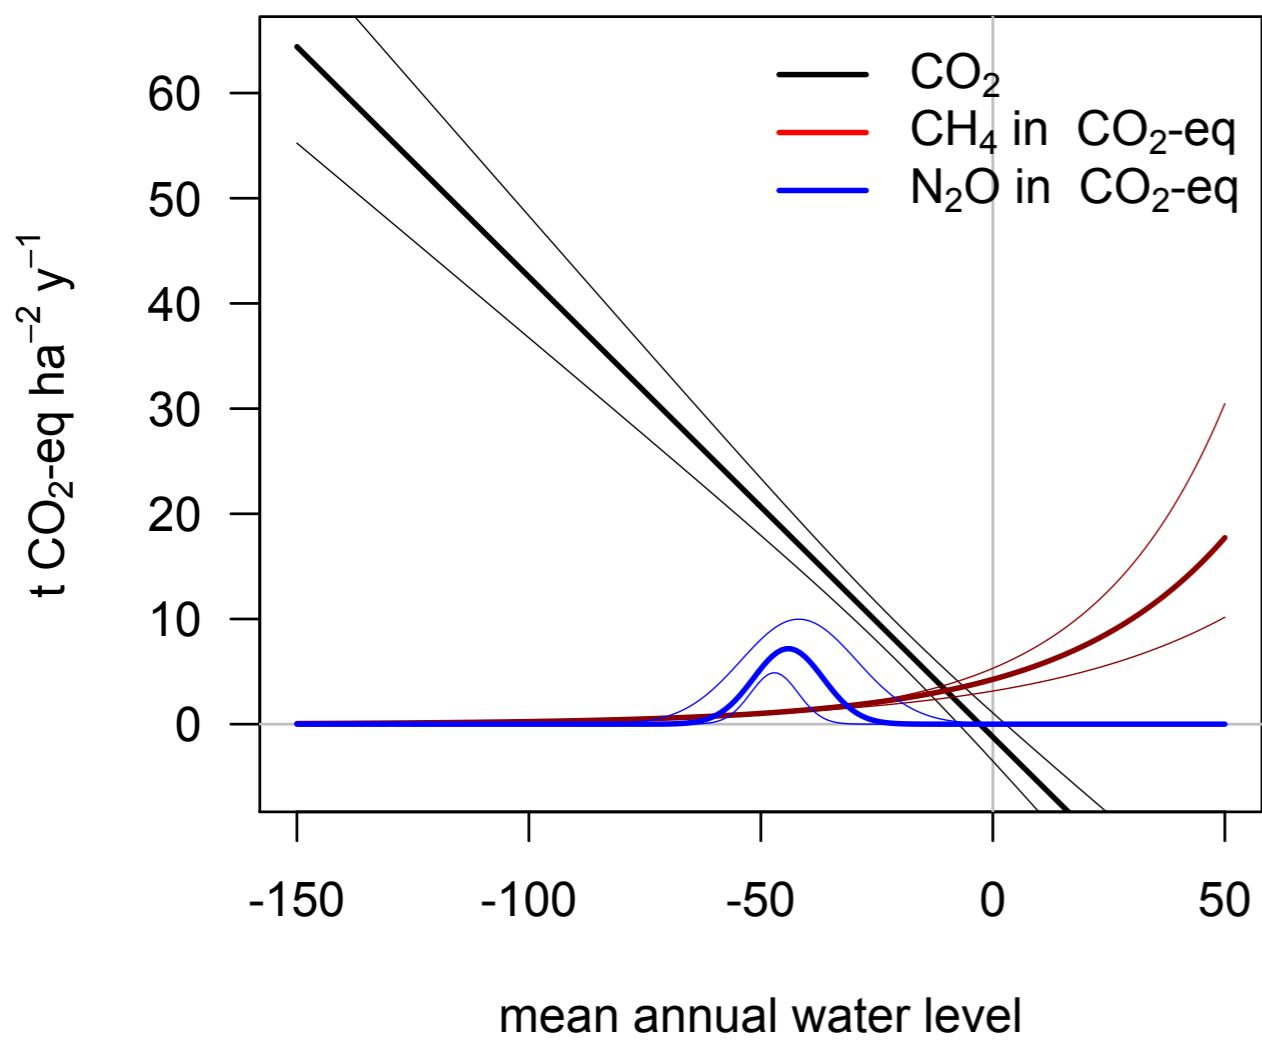

see also Posters of Günther et al. and Huth et al.

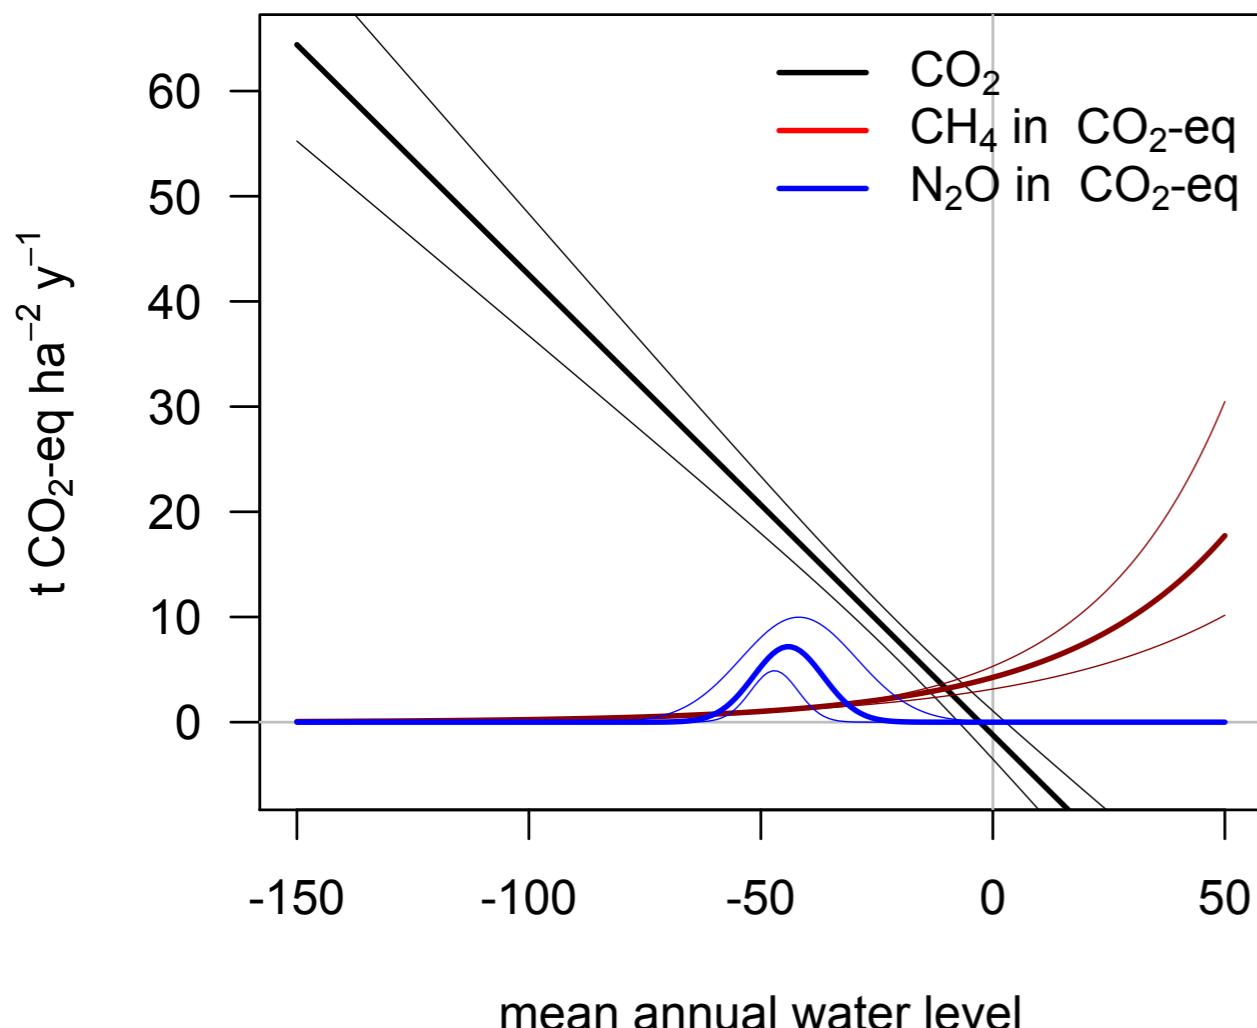

# $\text{N}_2\text{O}$ emissions higher under grazing and arable land

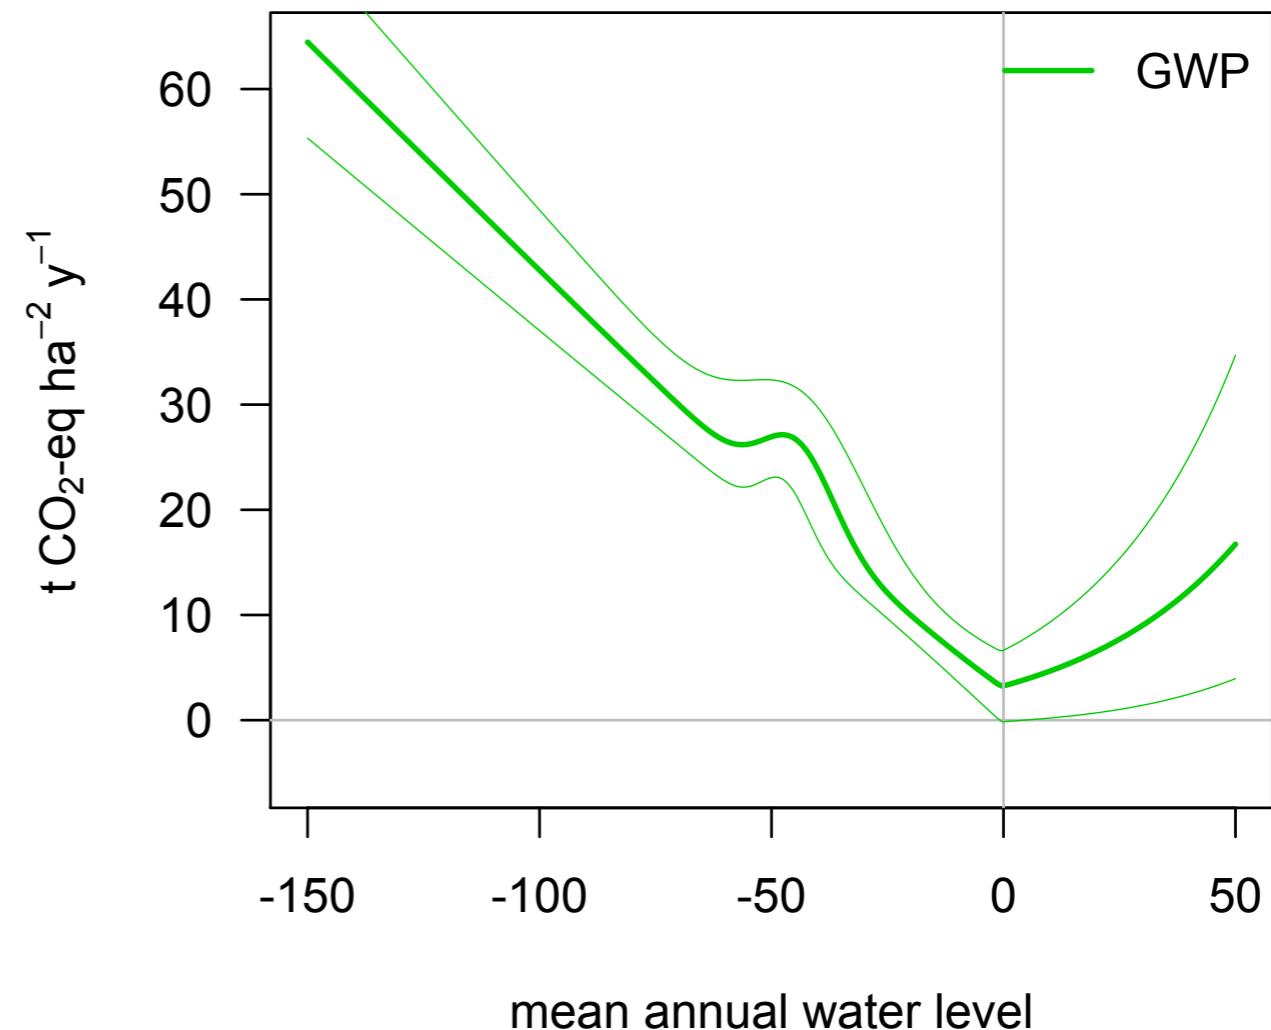

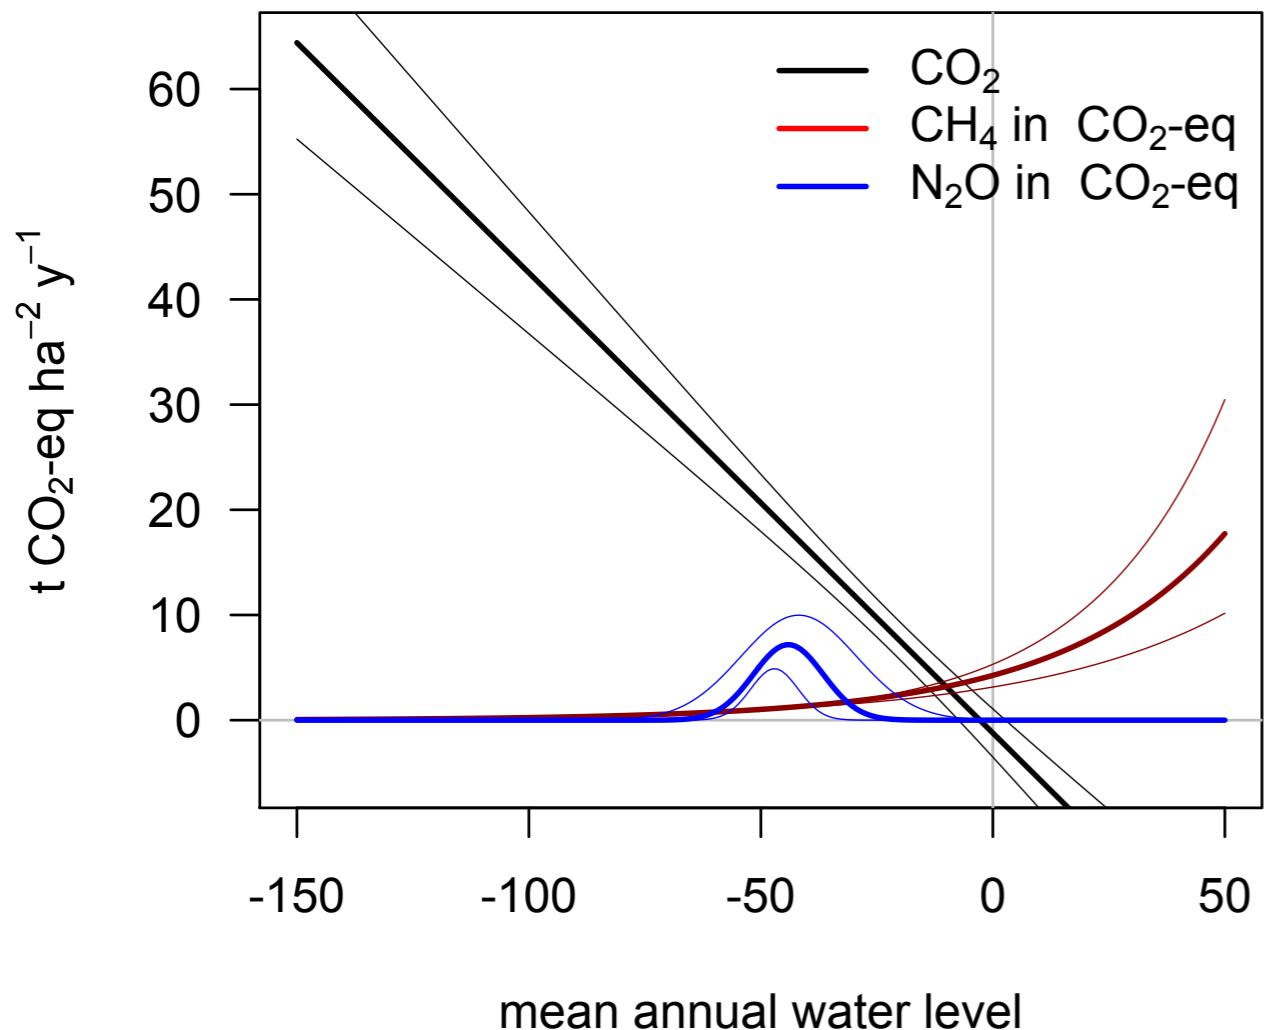

# GWP of temperate peatlands in relation to water table depth – Omit flooding when rewetting

# GWP of temperate peatlands in relation to water table depth – Omit flooding when rewetting

Rewetting reduces GWP of peatlands –  
Biomass harvest does not affect GWP negatively

# Rewetting reduces GWP of peatlands – Biomass harvest does not affect GWP negatively

- Main driver of GWP in peatlands is water level

# Rewetting reduces GWP of peatlands – Biomass harvest does not affect GWP negatively

- Main driver of GWP in peatlands is water level
- Rewetting reduces GWP, but flooding may lead to very high methane emissions shortly after rewetting

# Rewetting reduces GWP of peatlands – Biomass harvest does not affect GWP negatively

- Main driver of GWP in peatlands is water level
- Rewetting reduces GWP, but flooding may lead to very high methane emissions shortly after rewetting
- Biomass harvest does not affect the GWP of peatlands negatively

# Rewetting reduces GWP of peatlands – Biomass harvest does not affect GWP negatively

- Main driver of GWP in peatlands is water level
- Rewetting reduces GWP, but flooding may lead to very high methane emissions shortly after rewetting
- Biomass harvest does not affect the GWP of peatlands negatively
- Grazing seems to influence GWP slightly negatively, but needs to be further investigated

# Thank you for your attention
